From Idea to AI

Designing Custom Assistants in Copilot Studio

Mike Morrison | Jack Sproul
Solutions Architects | TD SYNNEX

Goals

Copilot Studio 101

Create an agent in Copilot Studio and ground with work data

Understand AI agent licensing

Tenant/Environment best practices

Feel more confident with Copilot Studio

Agenda

Topic
Course Outline – and logins to class tenants
Lab #1 – Web Bot
Copilot Studio 101 (discussion)
Lab #2 – Add work data as knowledge sources
AI Agent Licensing (discussion)
Lab #3 – Connect to external sources/agents
Tenant Management (discussion)

What would you like to build?
Agent
Workflow
Start building by describing what your agent needs to do

Let’s build a basic web Q&A bot

Here we go!

Step 2 – Create Agent

InnovAIte Test Agent

Overview | Knowledge | Tools | +6

Publish | Settings | ... | Test

Details

Edit

Name

InnovAIte Test Agent

1

Description 0/1024

Select your agent's model

Your agent will primarily use the model for reasoning and responding. Experimental models are subject to preview terms. Learn more

GPT-5 Chat

2

Triggers

Add trigger

Set up your agent to activate when certain events happen. Learn more.

Add trigger

Test your agent

Hello, I'm InnovAIte Test Agent. How can I help?

Just now

Ask a question or describe what you need

0/2000

You're testing your agent's real responses and capabilities. Find troubleshooting help here. Make sure AI-generated content is accurate and appropriate before using. See terms

InnovAIte Test Agent

Knowledge

Add data, files, and other resources to inform and improve AI-generated responses.

+ Add knowledge

Add knowledge

Web Search

Enable your agent to search all public websites. Learn more

Step 5 – Test!

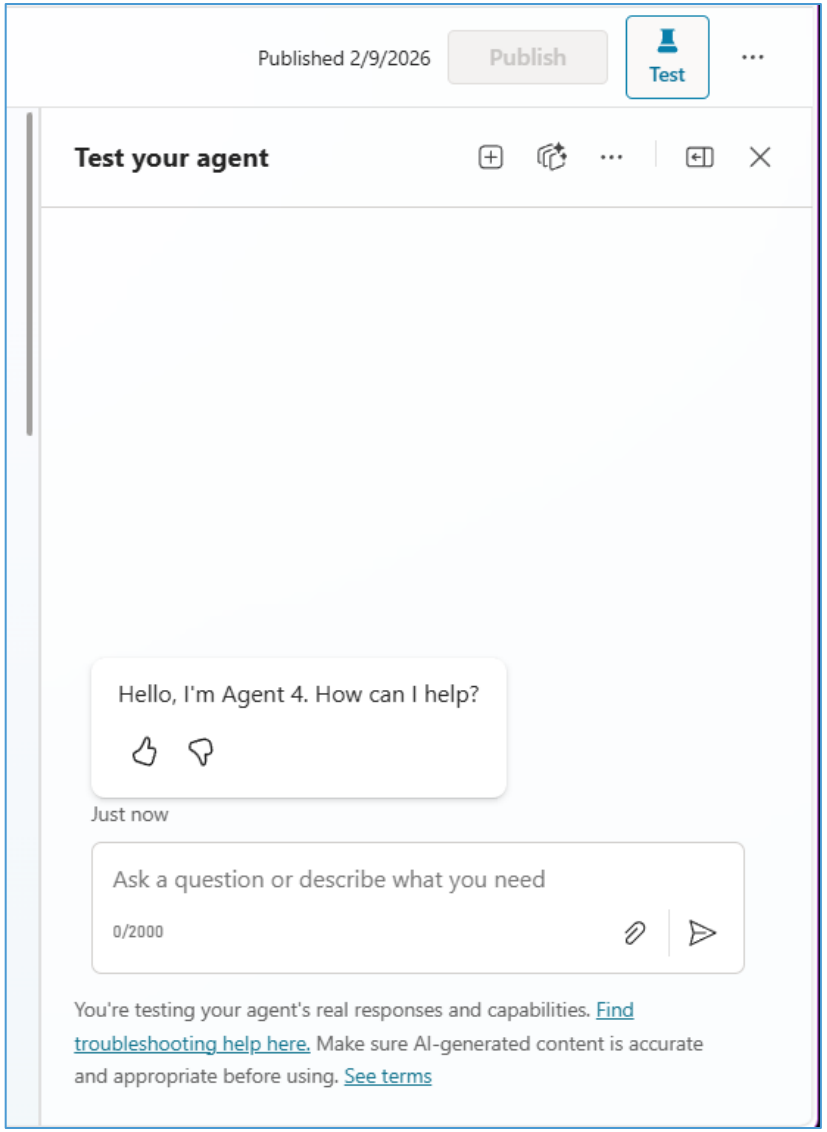

Use the right-side test chat

Ask some questions of your company

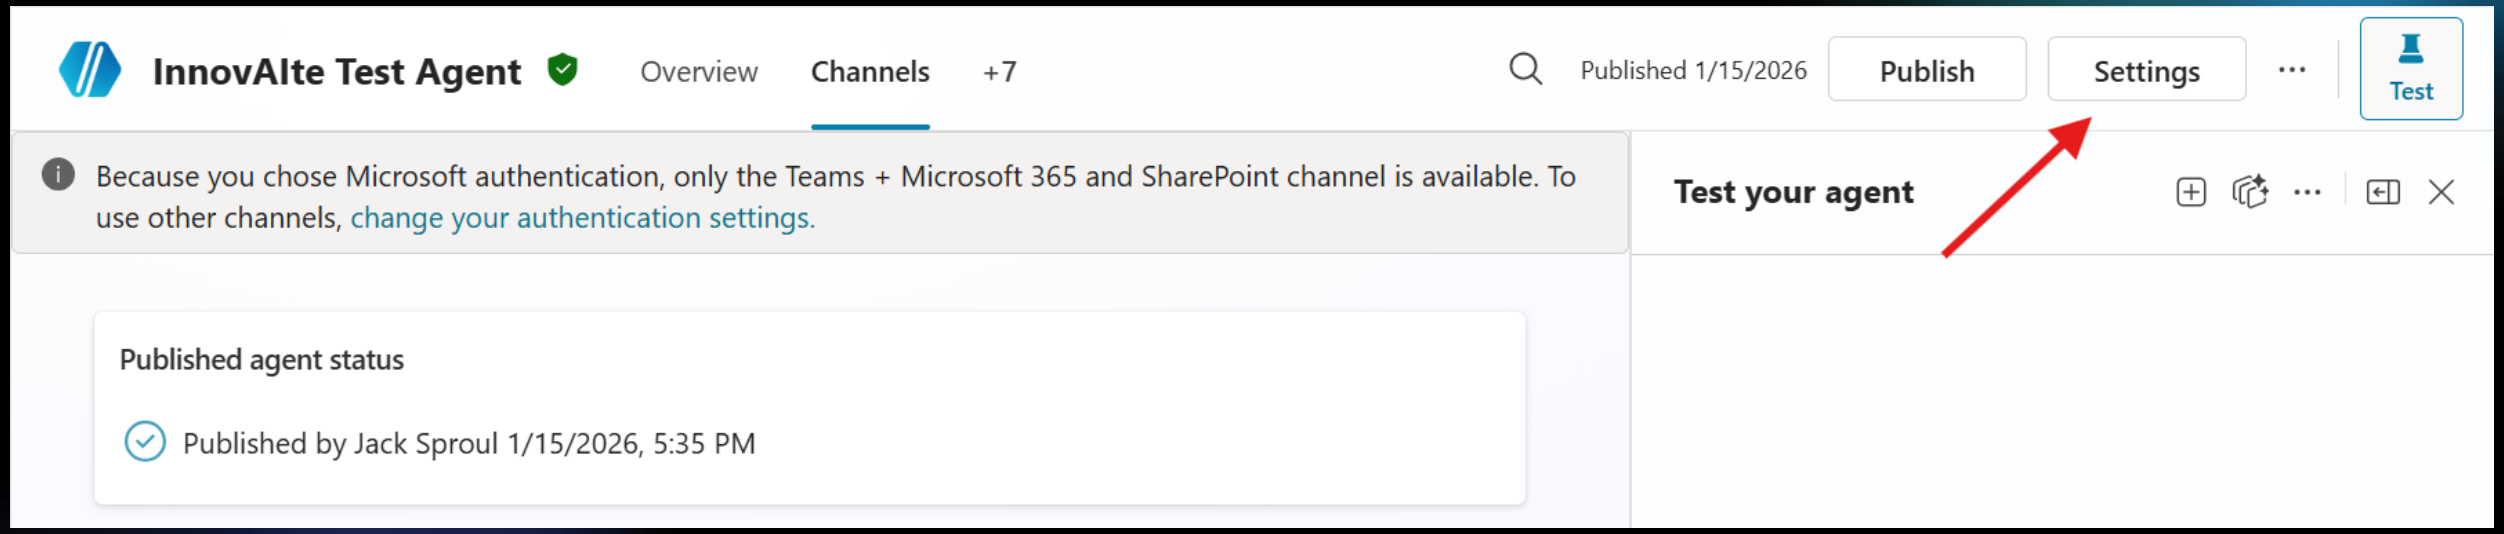

“What services or products do we offer?”

“What is (my company name)?”

“Where is (my company name) located?”

Deploy via Publish & Channels, then change settings according to security mode needed via which channel bot will surface in.

Settings

- Generative AI

you should see this page!

This site is your testing space before you roll me out to a broader audience. Try asking me a question in the chat window, or select a prompt below. Learn more

- "What products/services does this company offer?"
- "Where is this company located?"
- "Tell me 3 things that make this company stand out from others"

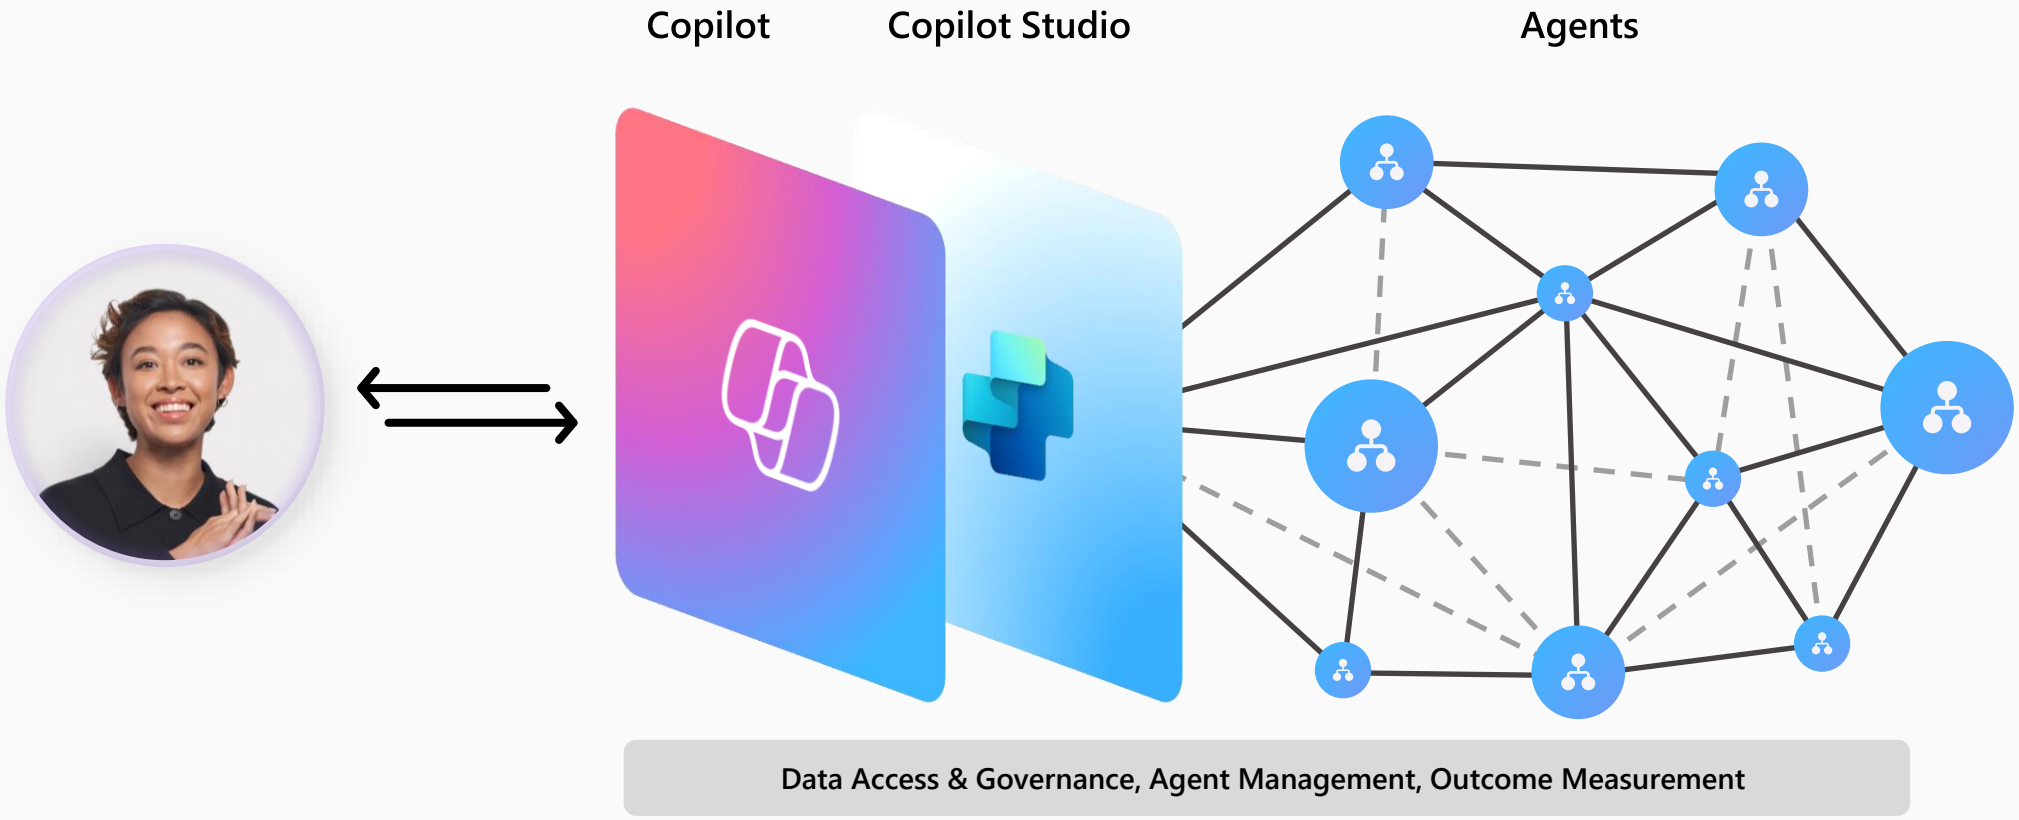

What just happened?

Let’s discuss

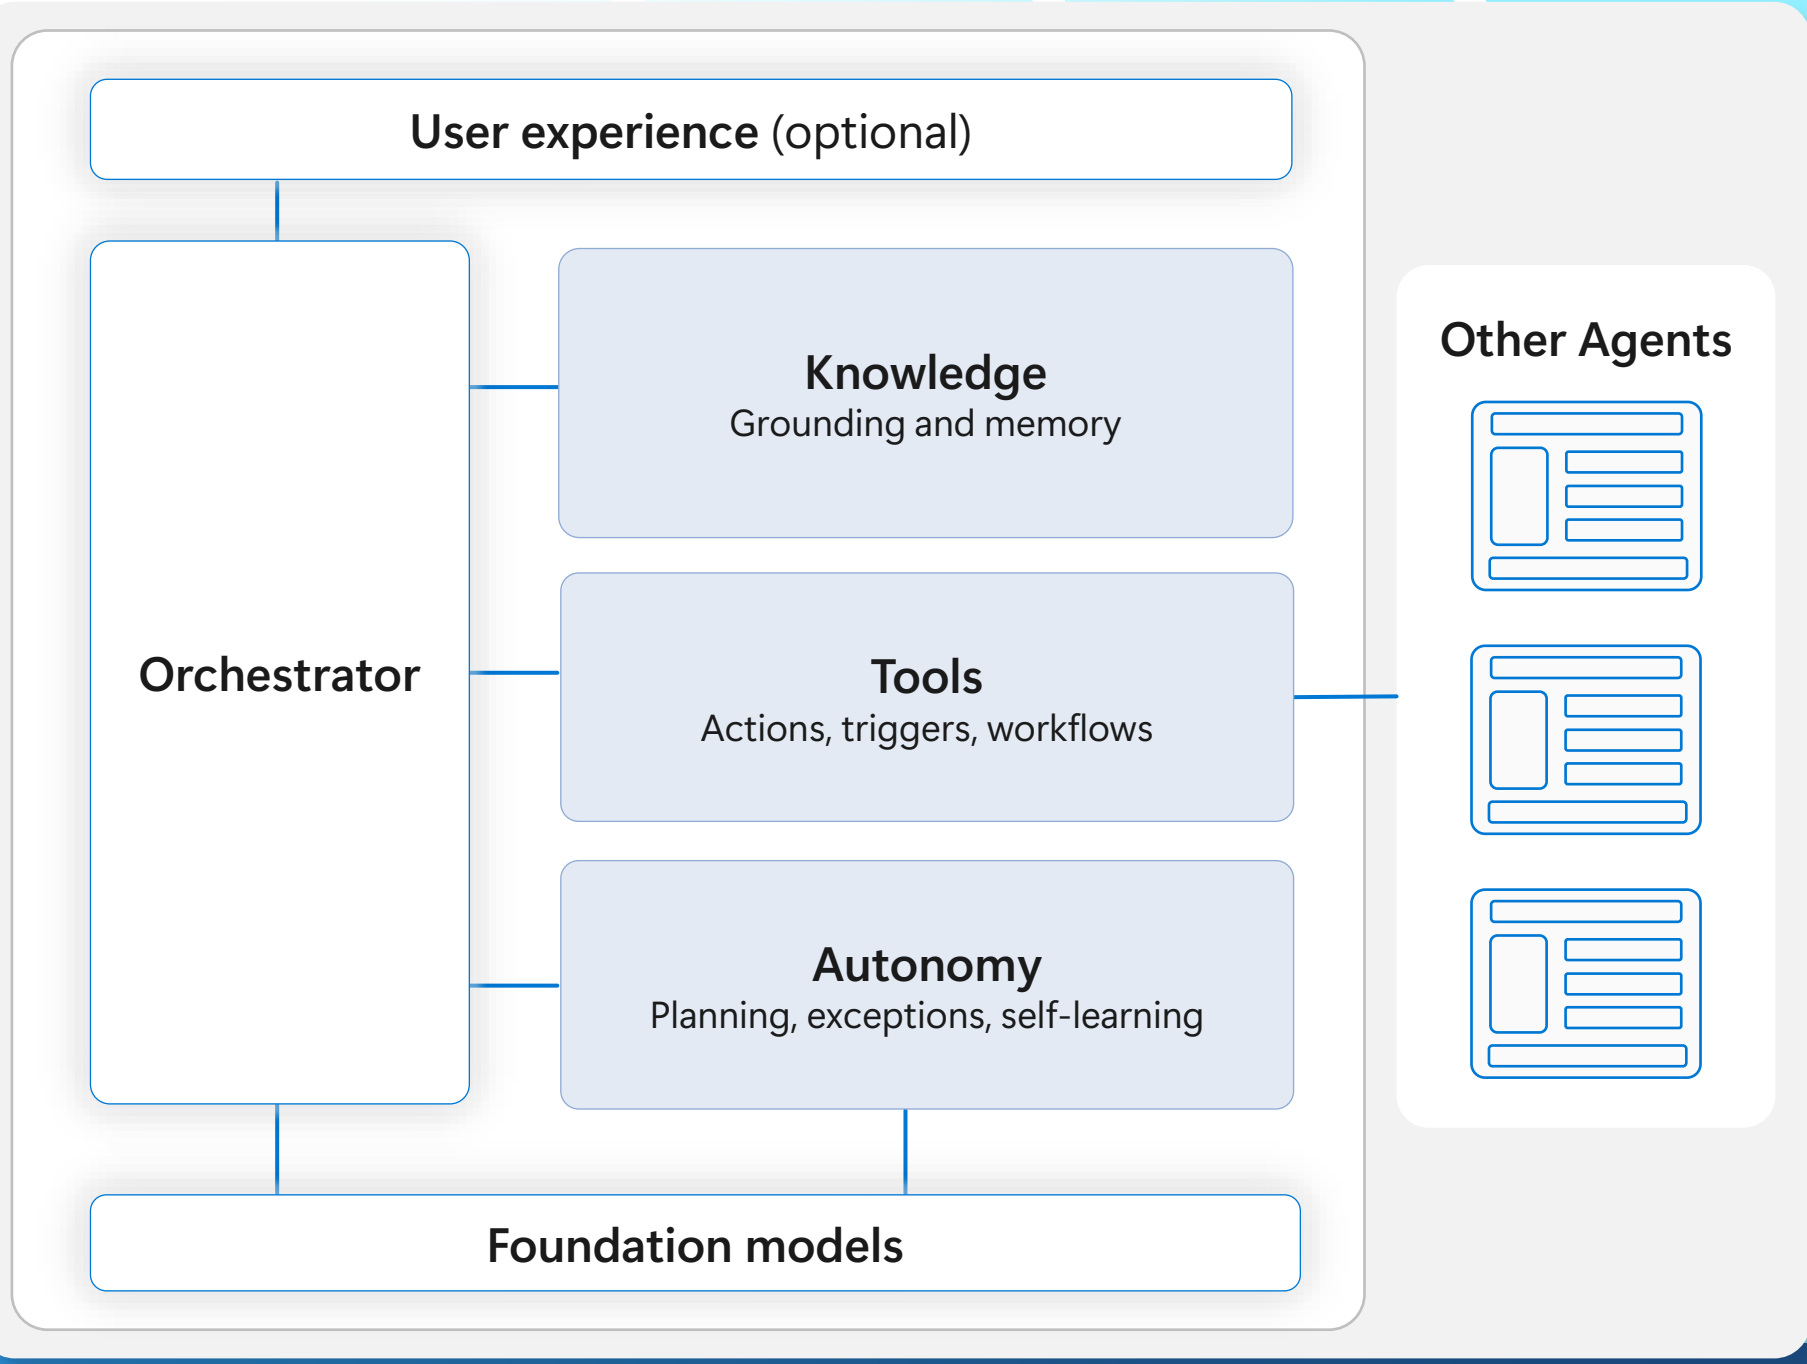

Copilot is the UI for AI

What are *Copilot agents?*

AI assistants designed to automate and execute business processes, working with or for a human.

Spectrum of agents

Simple → Advanced

Retrieval

Retrieve information from grounding data, reason, summarize, and answer user questions

Generally available

Task

Take actions when asked, automate workflows, and replace repetitive tasks for users

Generally available

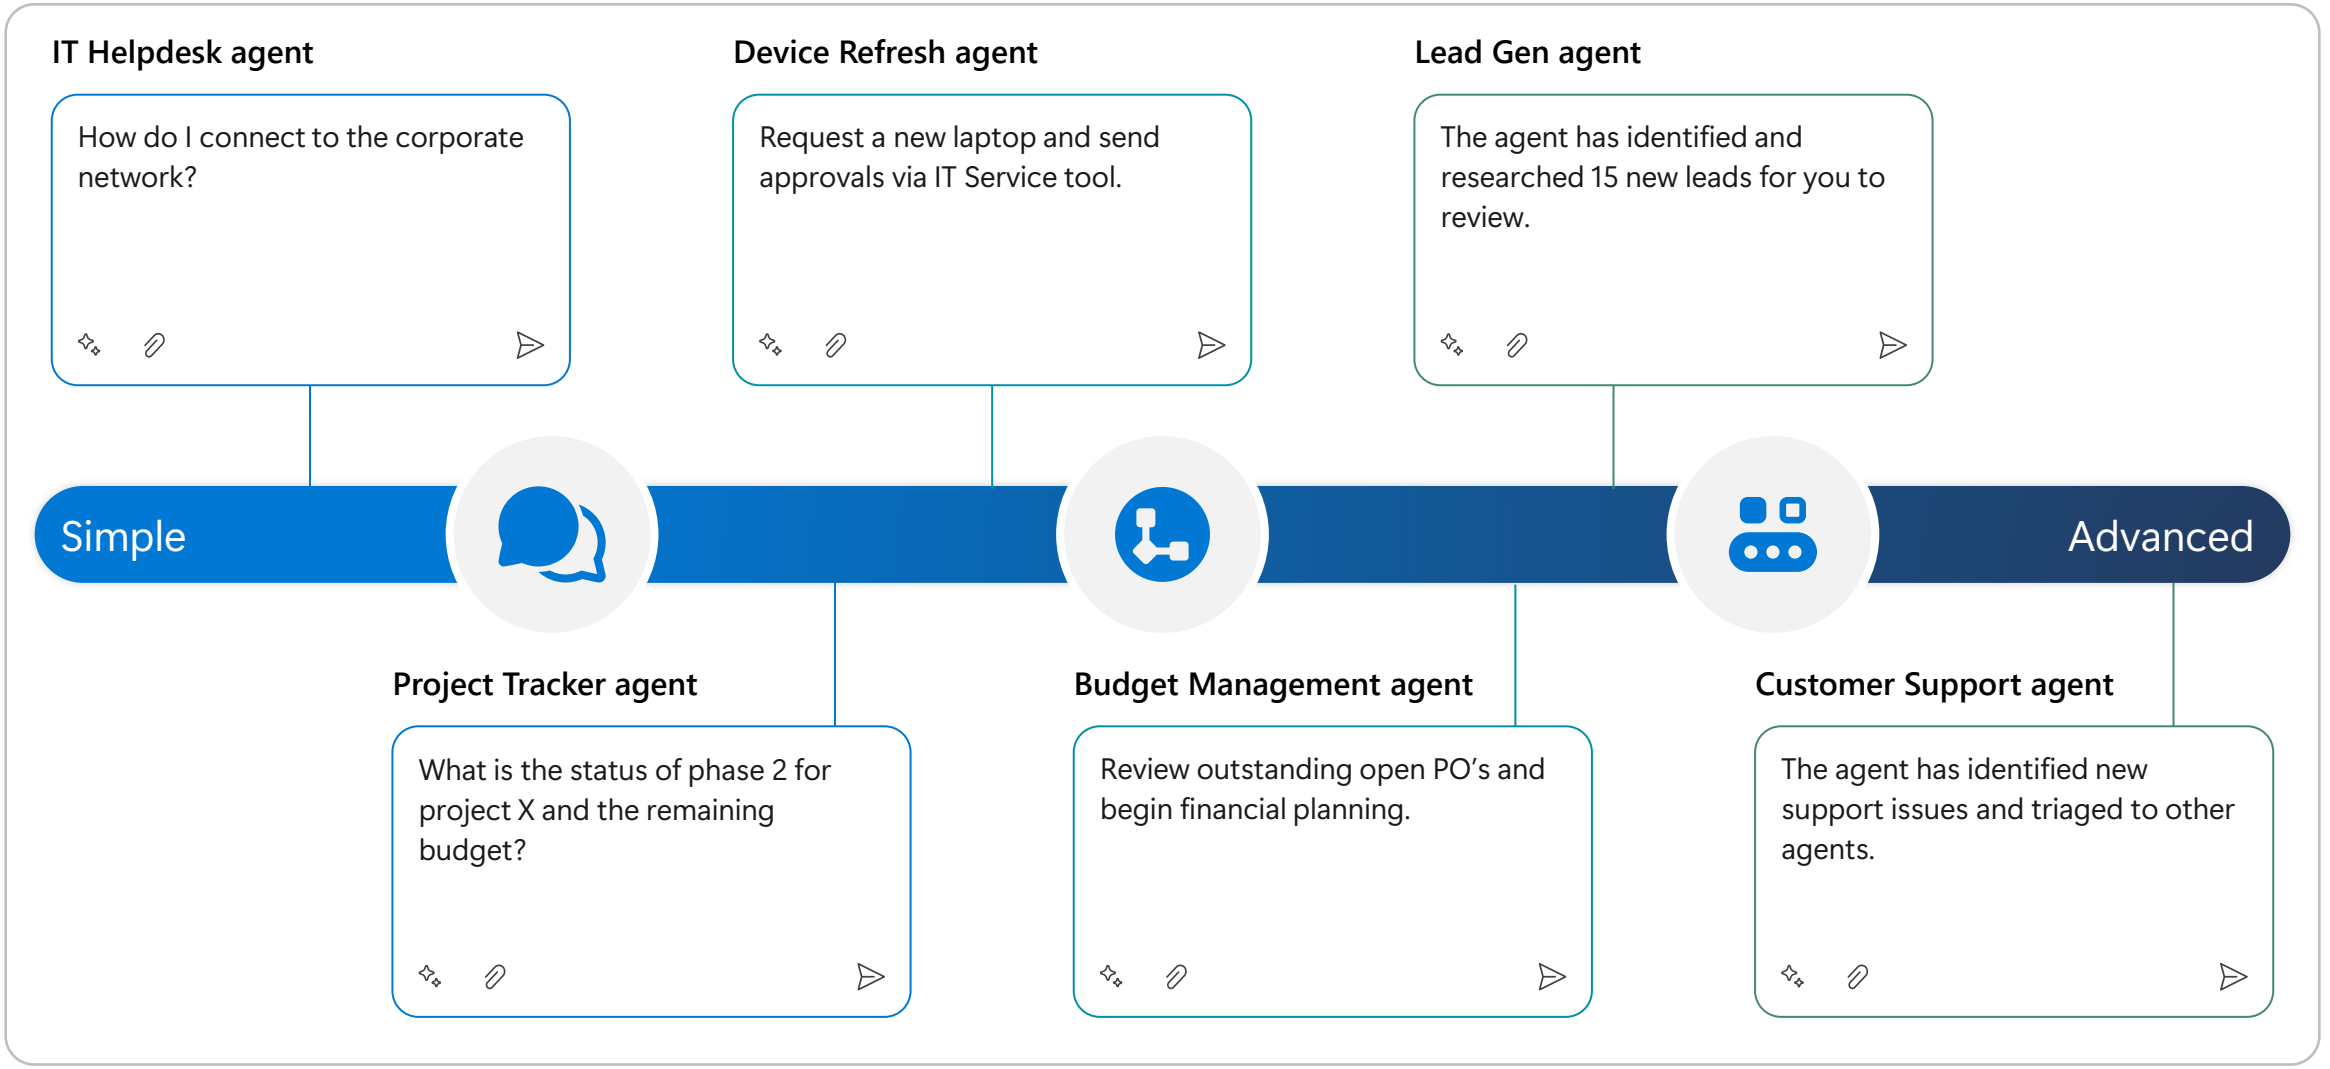

Autonomous

Operate independently, dynamically plan, orchestrate other agents, learn and escalate

Preview

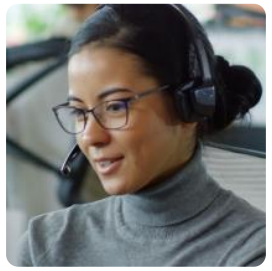

Agents vary in levels of complexity and capabilities depending on your need

Explore a continuum of solutions

Common business scenarios for agents

Accelerate how teams take action and make business impact

							
	Customer Service	**Sales**	**Finance**	**Marketing**	**HR**	**Legal**	**IT**
KPI Example	Lower average resolution time (ART)	Increase sales conversation rate	Lower analysis cycle time	Decrease time to market	Reduce onboarding time	Decrease IP documentation review time	Increase user satisfaction score
How Agents can assist	Generate answers based on specific deployments and processes	Collate relevant materials for customized proposals	Get cost savings recommendations by analyzing years of financial reports	Provide a 24/7 go-to for product updates and questions	Streamline learning and information consumption with role specific onboarding agents	Accelerate researching, summarizing, analyzing documentation	Analyze customer feedback for trends and opportunities to inform product roadmap

Customize your agent

Easily tailor your agent's building blocks to meet your unique business needs in a comprehensive, end-to-end studio

Building blocks

Knowledge

Existing enterprise data in or outside of M365 that you agent can query

Actions

Tasks and processes your agent can perform across LOB services/apps

Logic

Defined conversation paths for your agent to follow when triggered

Channels

Where and how your end users engage with your agent

Knowledge

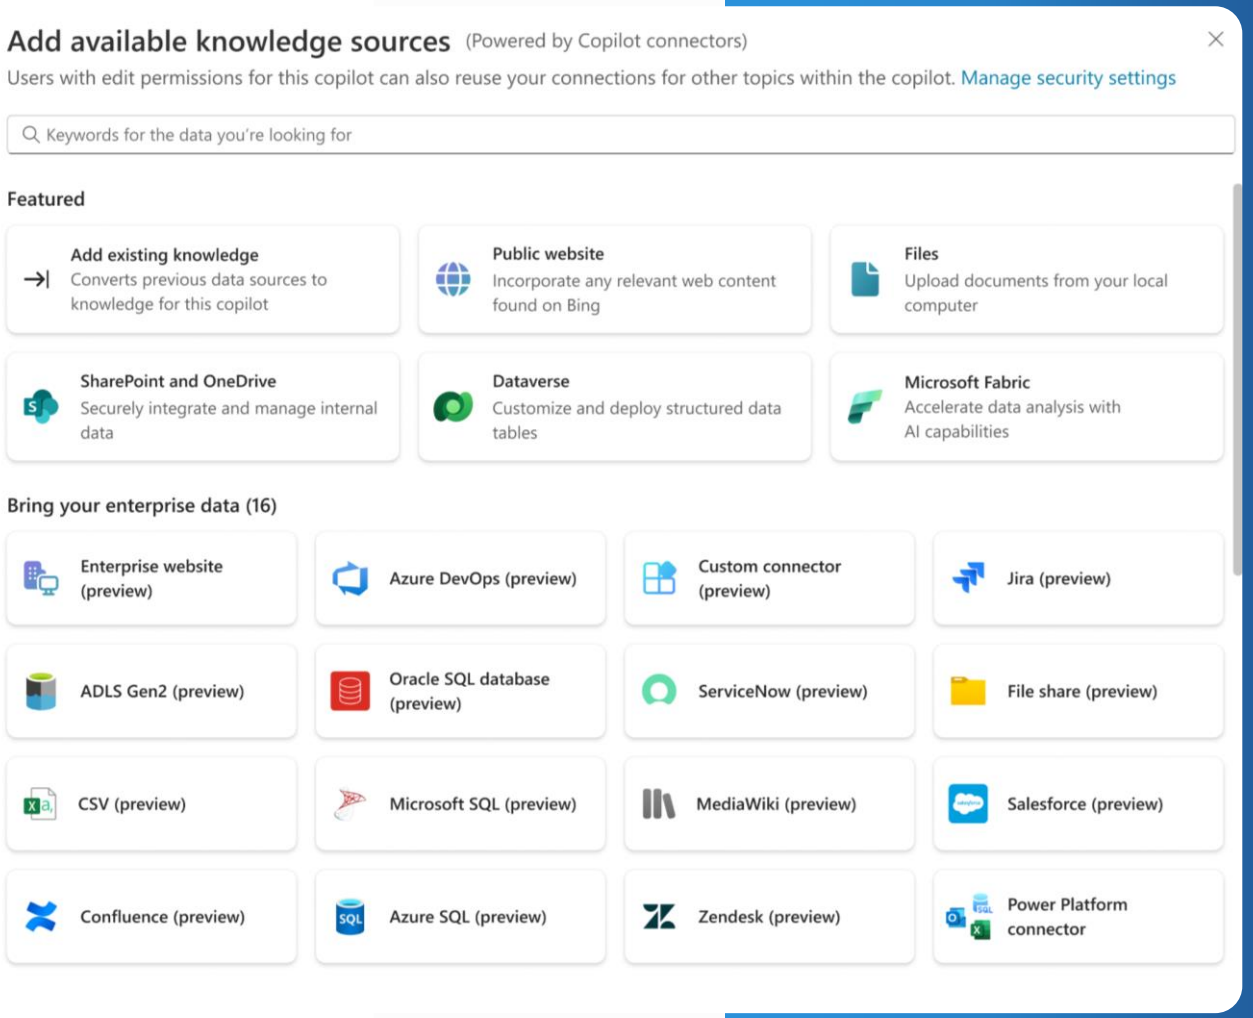

Add your **public and enterprise data** sources using agent connectors.

Your agent will be able to **dynamically generate multi-turn answers** in real time using your enterprise data.

Allows you to create an **immediately useful** agent.

Supported data sources include:

- Public websites
- Dataverse
- File uploads
- SharePoint/OneDrive
- Microsoft Fabric (coming soon)
- Microsoft Graph

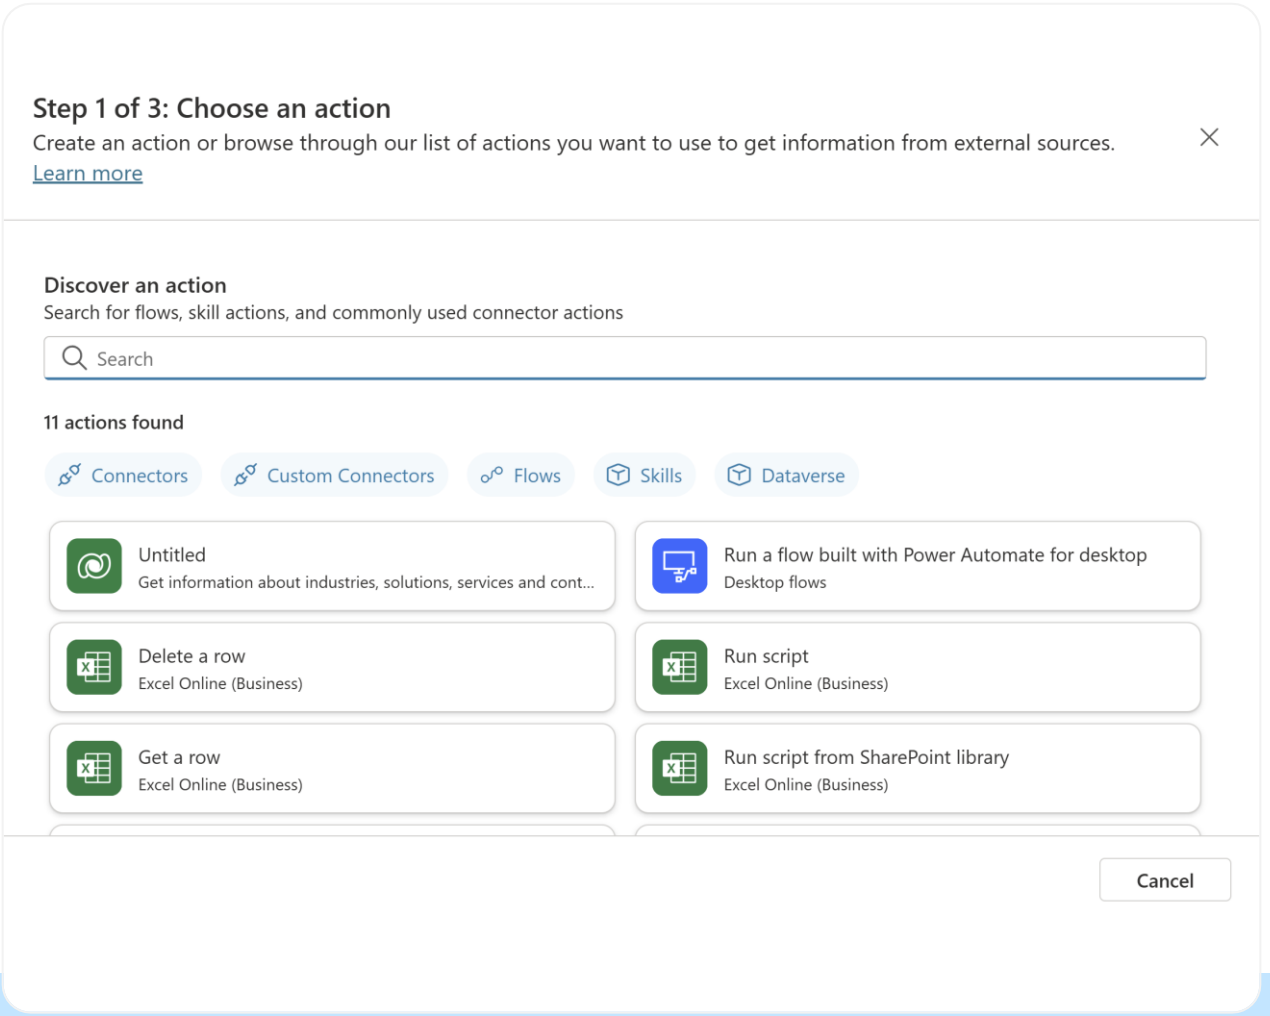

Actions

Easily connect to your key line of business systems.

Enable your agent to automate your business processes and complete tasks.

Tell your agent when to execute an action by adding autonomous triggers.

Types of actions	
Prebuilt connectors	Choose from 1400+ prebuilt Power Platform connectors to popular data sources and apps
Custom connectors	Create a custom connector for any publicly available API
Flows	Bring in automated workflows built using Power Automate
Prompts	Provide custom instructions to the GPT model using AI Builder
Skills	Add a bot built using Azure Bot Framework as a skill

1400+

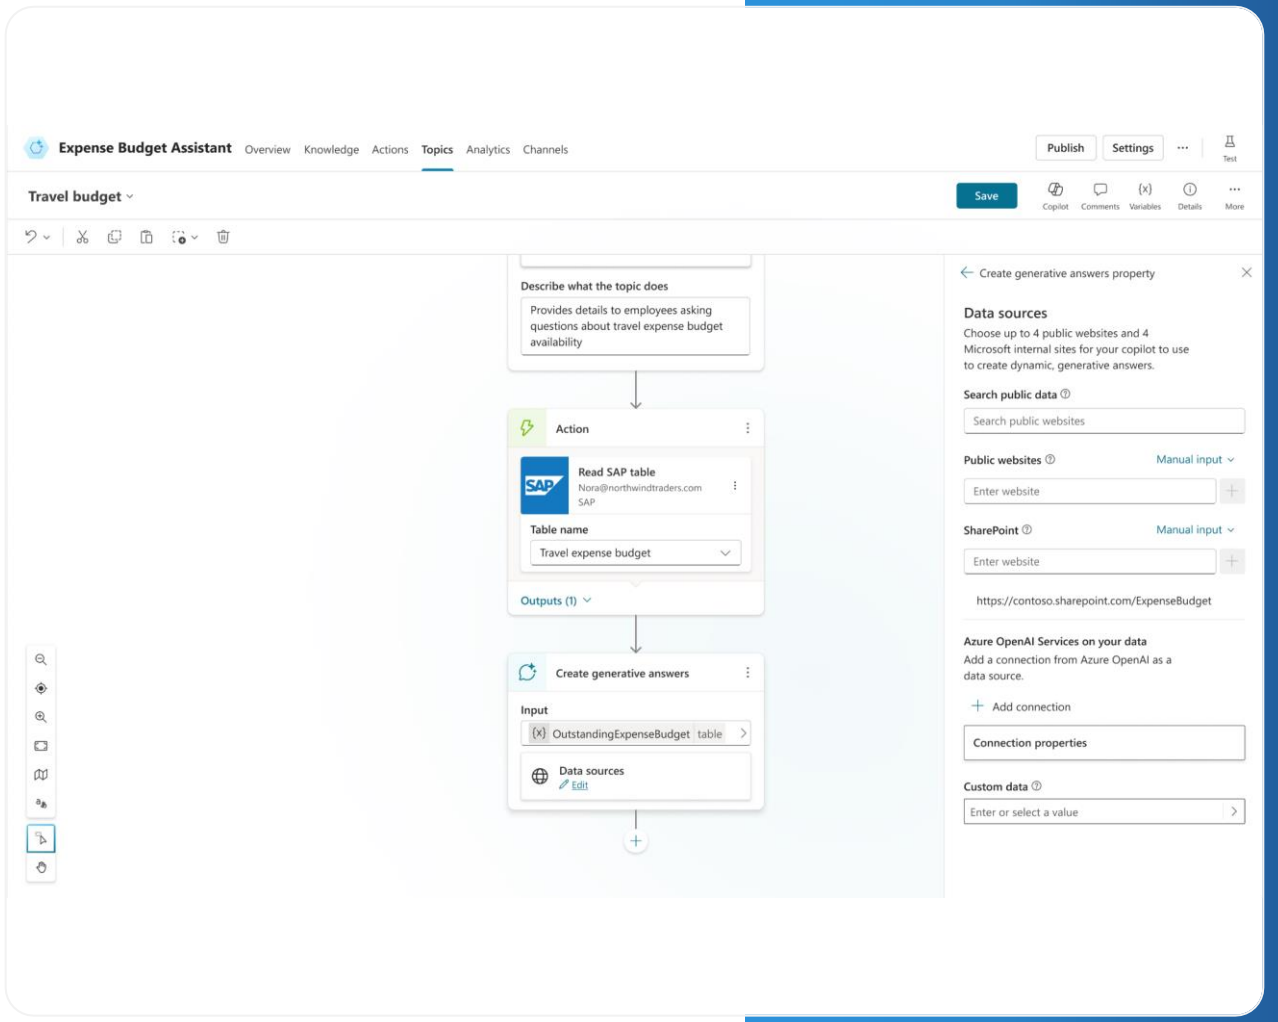

Logic

Have **complete control over critical scenarios** by designing specific step-by step topics.

Enable your agent to **automatically select the most appropriate action or topic** to respond to a user using generative AI.

Easily mix and manage both **generative and custom dialog** in one system.

Connect to your contact center so your agent can escalate and hand off the conversation with full context to a live human agent.

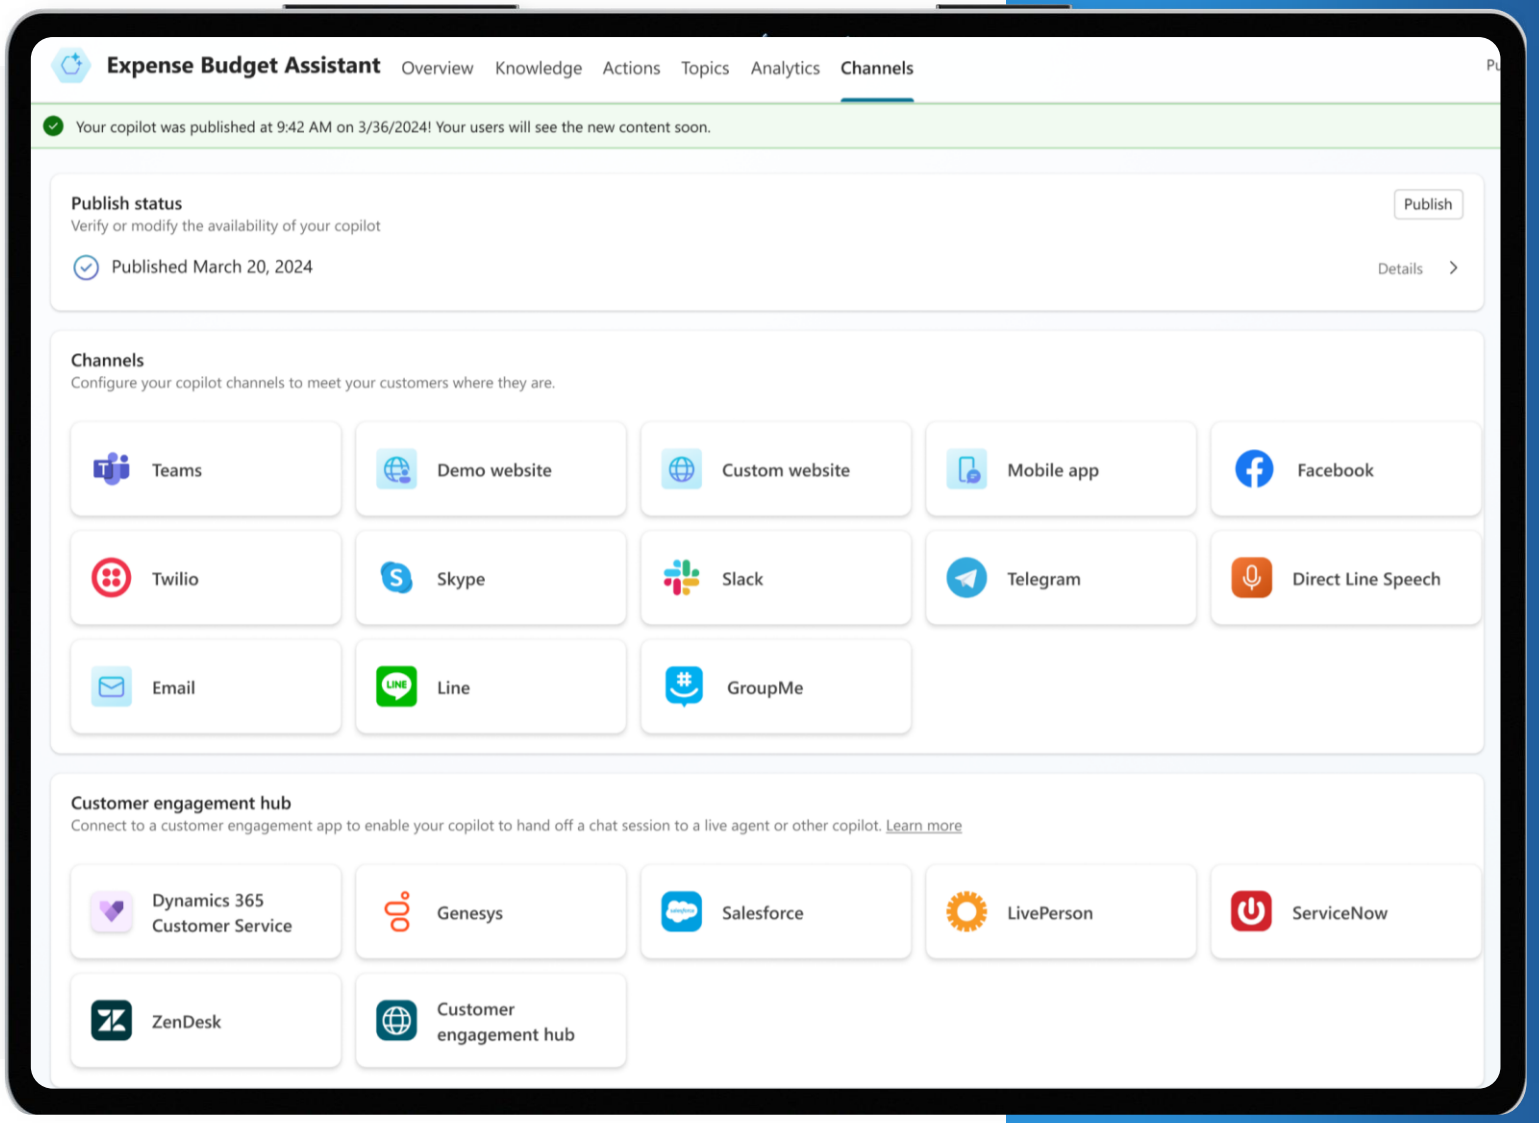

Channels

Publish and deploy to your channels of choice with a single click.

Add your agent to a custom app built with Power Apps or a custom website built with Power Pages.

You can access even more channels through ISVs, including:

- WeChat
- WhatsApp through Twilio
- Google's Business Messages
- Apple Messages for Business
- Azure Communication Services
- infobip
- NICE
- audiocodes
- telesign
- Custom

BREAK TIME

10 min break at top of hour (break 1)

LAB #2 – adding grounding data

Let's ask our agent some questions:

1. **What is my company's official corporate color?**
2. **What's my favorite food?**
3. **Where is my marketing team's home office?**

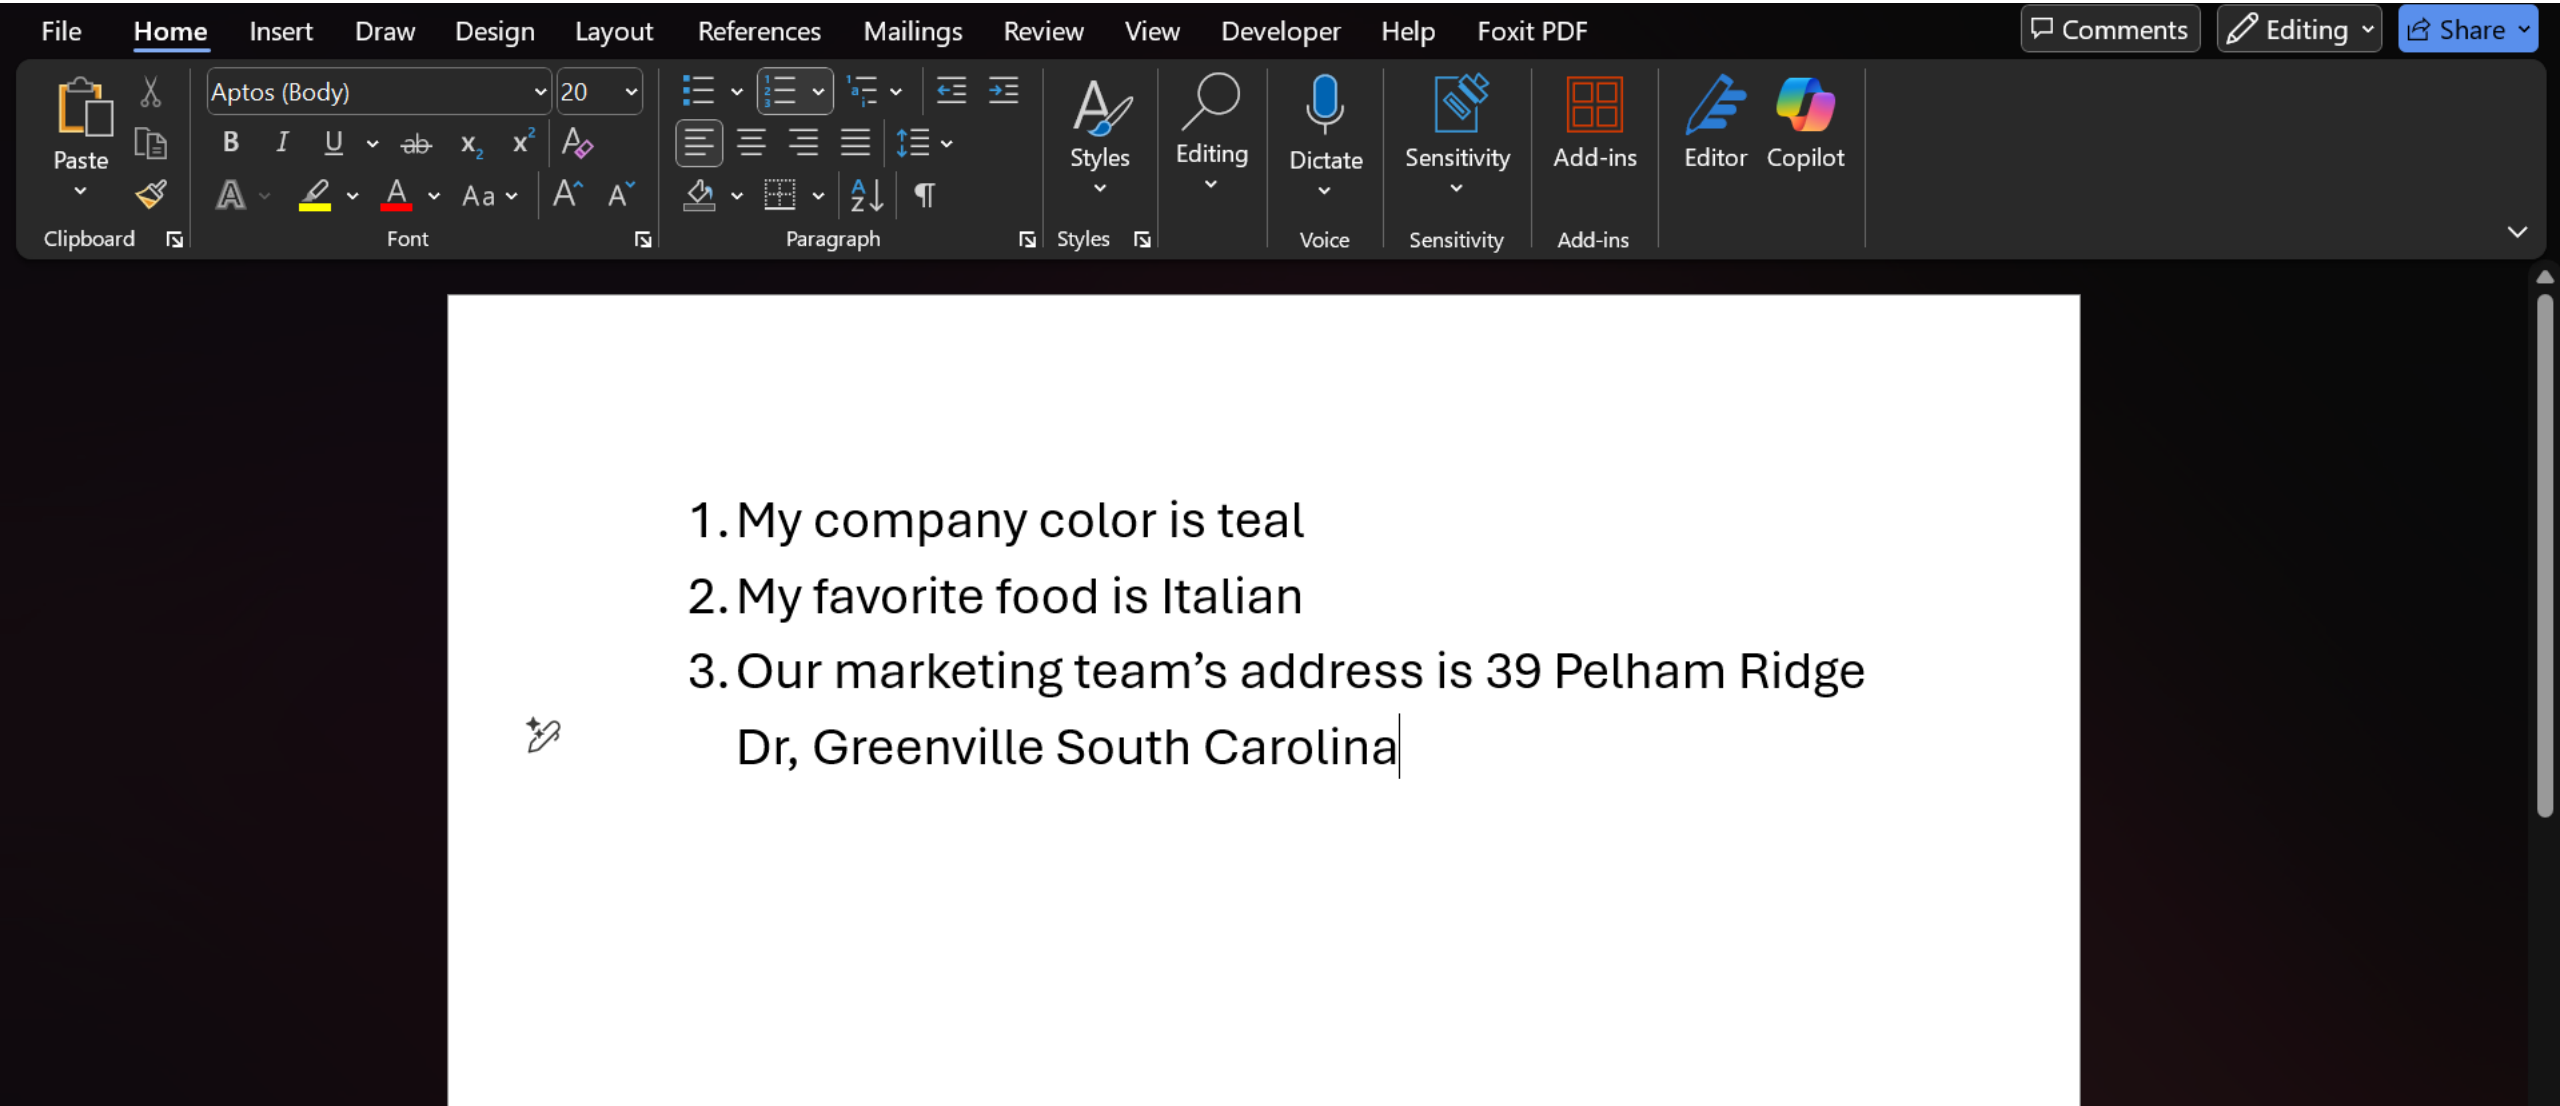

What happened?

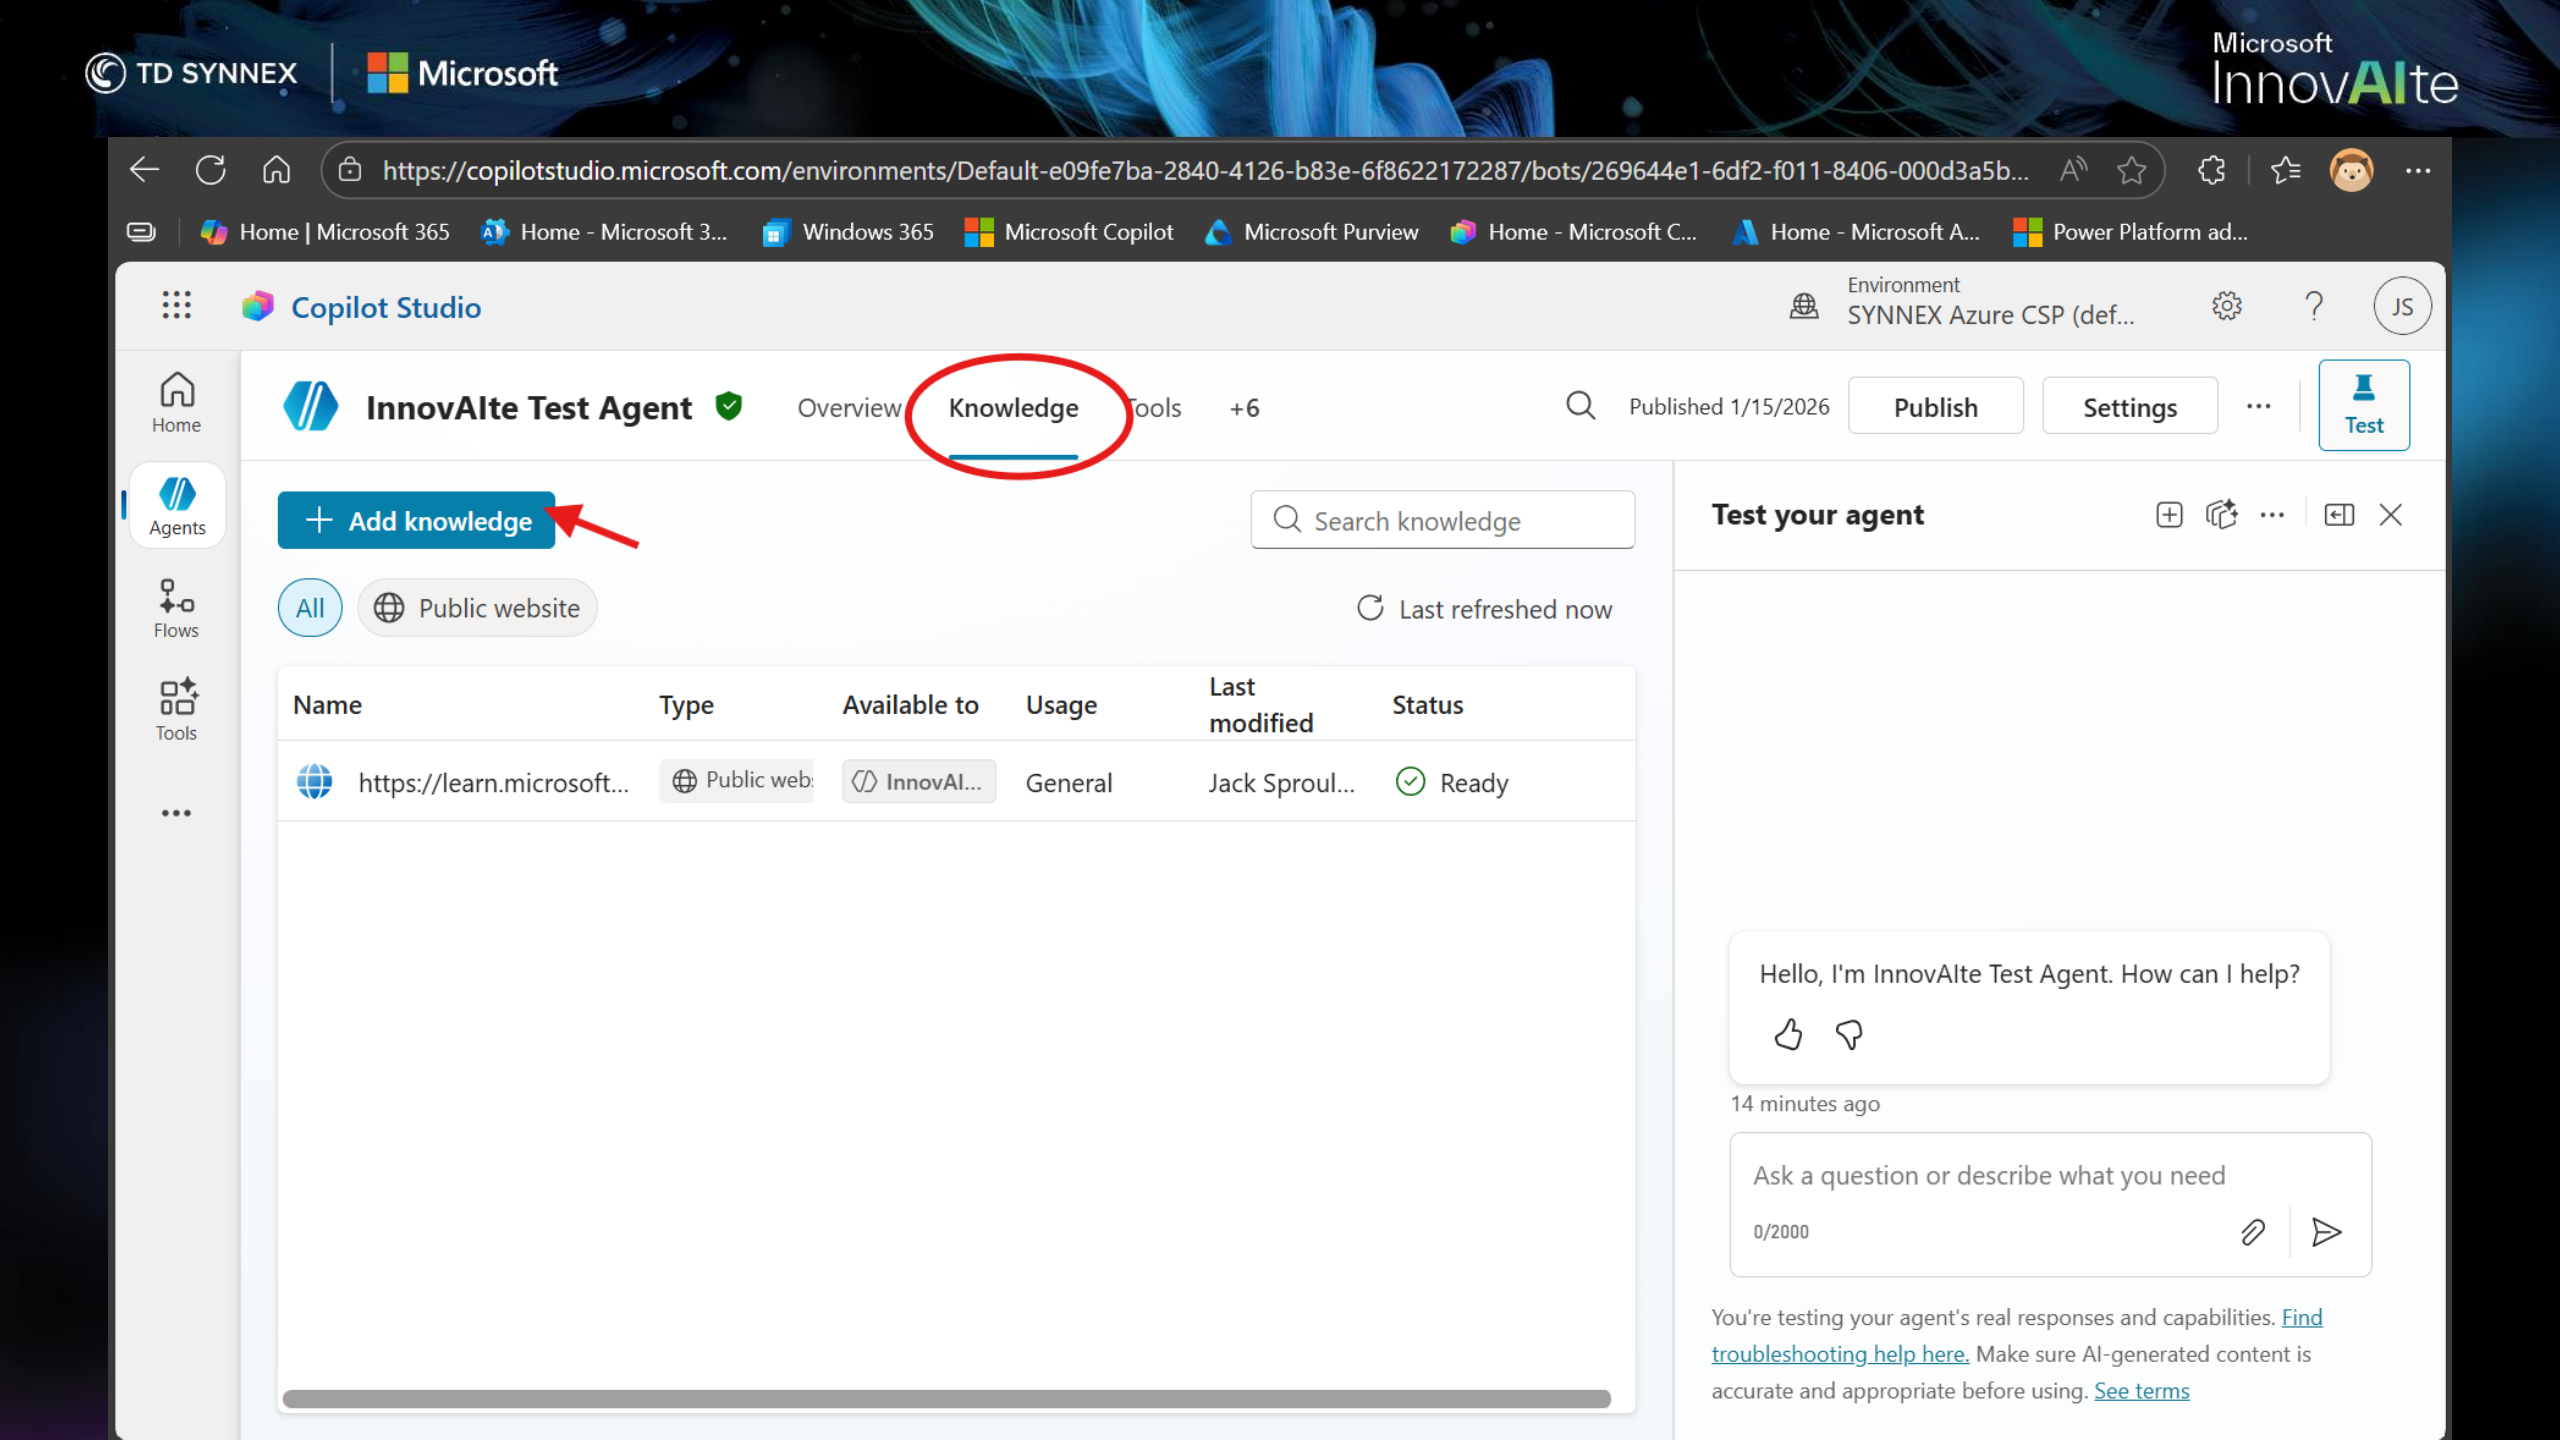

LAB #2 Sample Questions

Add the below into a Word doc, then we'll upload into the agent

- **What is your official corporate color?**
- **What is your favorite food?**
- **What is your marketing team's home office?**

https://word.cloud.microsoft/

Licensing

Microsoft 365 Copilot Chat

- Use secure, web-grounded AI chat powered by the latest large language models
- Get Copilot Chat in select Microsoft 365 apps
- Access and use agents, priced on a metered basis
- Maintain IT control, including enterprise data protection and agent management

Included and Metered

Microsoft 365 Copilot

Everything in Microsoft 365 Copilot Chat, plus:

- AI-powered chat grounded in business data
- Access work-grounded Copilot in apps
- Create and use agents with Copilot Studio
- Experience enterprise-grade security, privacy, and compliance

$30 user/month

Available 12/1

Microsoft 365 Copilot Business

- Created for small business
- Available for up to 300 Users
- Requires a Microsoft 365 Business license as a prerequisite (Business Basic, Business Standard, Business Premium)

$21 user/month

Copilot Studio Licensing

Summary of Microsoft Copilot Studio

Plans	Microsoft Copilot Studio • MCS Pay-As-You-Go • MCS License (Copilot Credit capacity pack) • Copilot Credit Pre-Purchase Plan	Copilot Studio use rights with Microsoft 365 Copilot Microsoft 365 Copilot $30 per user/month
Included agent usage[1]	Pay-as-you-go: unlimited[2] License (capacity pack): 25,000 Copilot Credit /pack[3] Pre-Purchase Plan: Depends on the tier[3]	Fair Usage Limit[4]
Create and publish your own agents and agent flows anywhere	●	
Create and Publish your own agents and plugins to extend Microsoft 365 Copilot	●	●
The output you create is...	Your own agent	Your own agent[5]

Managed Environments	●[7]	●[7,8]
Available channels to publish agents/plugins	External channels (e.g., External Web, FB, WhatsApp etc.) Internal Channels (e.g., Internal Web, Teams, etc.)	Microsoft 365 experience

Copilot Studio licensing options

Activate Copilot Studio subscription to enable Microsoft 365 Copilot Chat

For Custom Copilots built in Copilot Studio or AI Builder
When users need to run Custom Copilots aka “AI agents” built in **Copilot Studio**, there are three (3) licensing options

· **Microsoft 365 Copilot license:** MSRP $30.00/user/month for this add-on to select M365, O365, Teams, Visio, etc. licenses, see full list here: **License Options for Microsoft 365 Copilot,**

· **Microsoft Copilot Studio pay-as-you-go:** This is enabled via an Azure subscription and a billing policy created in the Power Platform Admin portal, **Set up a pay-as-you-go plan - Power Platform**

· **Copilot Credit capacity (***Packs of Pre-Purchase bundles)* These capacity packs are pre-purchased and expire at the end of the licensing term.

Copilot Studio Credits

· **Microsoft Copilot Studio pay-as-you-go meter:**
Price **$0.010** per credit. Each Copilot credit consumed by an AI agent or AI Builder results in a billing meter added to the Azure Subscription. These are then incorporated into the entire services charged to the Azure Subscription and sent out at the end of each month. Copilot Studio agents consume *Copilot Credits* based on the type of activity they perform, not a fixed number per agent. The exact consumption depends on how the agent is designed (e.g., orchestration, knowledge queries, API calls, AI Builder usage) and how users interact with it

· **Microsoft Copilot Studio license (Copilot Credit capacity pack) Price: $200 per-pack/month.**
One capacity pack = 25,000 Copilot Credits. Each Copilot credit costs **$0.008** and is valid only for the month; any unused credit will expire at the end of the month.

· **Copilot Credit Pre-Purchase Plan**
(Tiered discounting schedule below) Each **Copilot Credits Commit Unit** (CCCU) has a base price of USD $1.00 and converts to 100 Copilot Credits. EX: Tier 1, Each Copilot credit is **$0.0095.** Tier 9, Each Copilot credit is **$0.0080.** *(note: these are yearly commits and any unused capacity expires at EOY)*

Copilot Credit Commit Units volume tiered pricing

Tier	Copilot Credits Commit Units (CCCU)	# of Copilot Credits (1 CCCU = 100 Copilot Credit)	# of monthly MCS licenses (Copilot Credit capacity pack)	Price	Discount	Cost per Credit
1	3,000	300,000	1 pack * 12 months	$2,850	5%	0.0095
2	15,000	1,500,000	5 packs * 12 months	$14,100	6%	0.0094
3	30,000	3,000,000	10 packs * 12 months	$27,900	7%	0.0093
4	150,000	15,000,000	50 packs * 12 months	$138,000	8%	0.0092
5	300,000	30,000,000	100 packs * 12 months	$270,000	10%	0.0090
6	750,000	75,000,000	250 packs * 12 months	$660,000	12%	0.0088
7	1,500,000	150,000,000	500 packs * 12 months	$1,290,000	14%	0.0086
8	2,250,000	225,000,000	750 packs * 12 months	$1,867,500	17%	0.0083
9	3,000,000	300,000,000	1000 packs * 12 months	$2,400,000	20%	0.0080

Copilot Studio Pricing Models Comparison

Feature / Model	License (Capacity Pack)	Pay-As-You-Go (Azure Meter)	Commit Units (Tiered Pre-Purchase)
Pricing Basis	Fixed monthly pack	Consumption-based billing	Annual volume commitment
Unit Cost	$200 per pack/month, 25,000 credits ($0.008/credit)	$0.010 per credit	$0.0095 - $0.0080 per credit (tiered)
Flexibility	Predictable, fixed allocation	Highly flexible, scales with usage	Locked annual commit, tiered discounts
Expiration	Credits expire monthly	No pre-allocation, billed monthly	Credits expire at end of year
Best For	Steady workloads with predictable usage	Variable or unpredictable workloads	Large enterprises with high, consistent demand
Admin Setup	Licensed via M365/O365 add-on	Requires Azure subscription + billing policy	Contracted commit, managed centrally
Discounts	None (flat rate)	None	5%–20% depending on tier volume
Consumption Model	Credits consumed by agent activities (orchestration, queries, API calls, AI Builder)	Same as license, but metered	Same as license, but discounted bulk credits
Risk	Unused credits expire monthly	Potentially higher cost if usage spikes	Unused credits expire annually

Copilot Studio feature	Billing rate	Used by Microsoft 365 Copilot licensed user[1]
Classic answer	1 Copilot Credit	No charge
Generative answer	2 Copilot Credits	No charge
Agent action	5 Copilot Credits	No charge
Tenant graph grounding for messages	10 Copilot Credits	No charge
Agent flow actions *per 100 actions*	13 Copilot Credits	No charge
AI tools		
- Text and generative AI tools (basic) per *10 response*	1 Copilot Credit	No charge
- Text and generative AI tools (standard) per *10 response*	15 Copilot Credits	No charge
- Text and generative AI tools (premium) per *10 response*	100 Copilot Credits	No charge
- Content processing tools per *page*	8 Copilot Credits	No charge

Agent type

Agent type specifies whether the agent is deployed internally for employee interactions or externally for customer and partner conversations. Deployment location impacts usage trends, aiding in accurate consumption forecasting. Learn more

What is your agent type? *

- ◯ Employee-facing agent (Copilot Studio)
- ◯ Customer or partner-facing agent (Copilot Studio)

Agent traffic

Agent traffic quantifies the activity an agent supports by assessing the number of end users accessing the agent and their monthly engagement frequency

How many users? *

e.g. 1000

On average, how many times per month will your users interact with your agent? *

e.g. 30

Agent knowledge

Knowledge sources enable agents to provide relevant information and insights. Published agents use configured knowledge sources to ground their responses. Learn more

What is the percentage of responses from knowledge? *

Total Estimated Monthly Copilot Credit Usage

Copilot credits driven by knowledge -

- Copilot credits consumed for tenant graph grounding -
- Copilot credits consumed for non-tenant graph grounding: Dataverse, web, files -

Copilot credits driven by agent tools -

Copilot credits driven by agent flows -

Copilot credits driven by optional modifiers -

Prompts

NOTES

· Always recommended to attach an Azure subscription for Pay-Go billing to cover any incremental overages beyond planned capacity purchases covered by Capacity Packs and/or Pre-Purchase capacity.

· Agents build in the User/Teams focused AI tool “Copilot Lite” do not reside in a typical Power Platform environment, so to setup Pay-Go one would go to **Billing & usage - Microsoft 365 admin center**.

· Copilot Studio agents consume Copilot Credits based on the type of activity they perform, not a fixed number per agent. The exact consumption depends on how the agent is designed (e.g., orchestration, knowledge queries, API calls, AI Builder usage) and how users interact with it

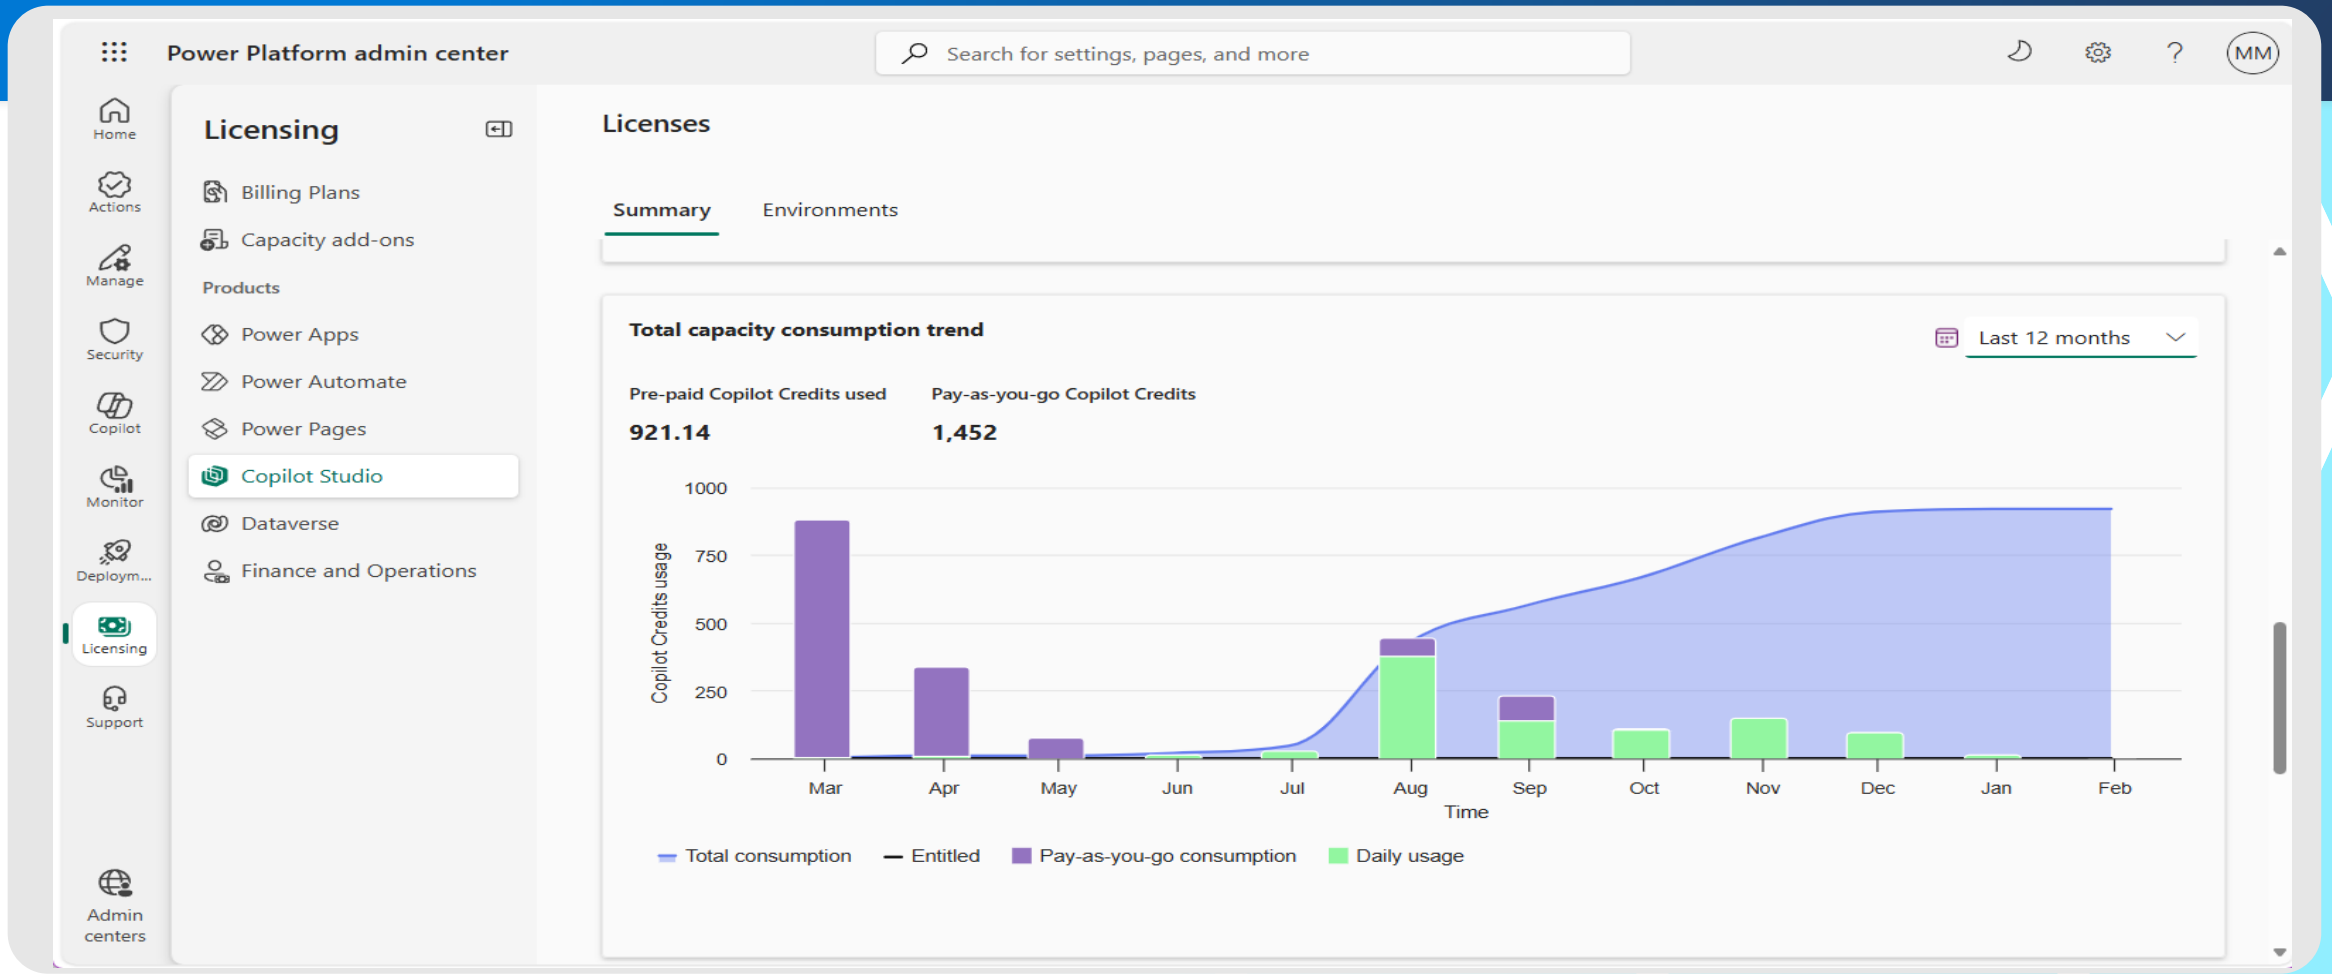

· The User setting up Pay-Go for Copilot Studio will need contributor or greater rights to an Azure subscription. They should also pre-create a resource group in Azure prior to creating a billing plan* in the Power Platform admin center. *It is recommended to name the resource group something like “Copilot-Billing” so other Azure Users can clearly see this resource group is used to collect the copilot billing meters.

· With the Full Copilot Studio experience, Pay-as-you-go is only configurable for production and sandbox environments, so Power Admins will need to work with the users to create a Production environment for their purpose.

· **Never have your users use the Default Environment!** These are clearly tagged with the suffix “(default)”. *See: Why should we not use the default environment for production? **https://global-sharepoint.com/sharepoint/power-platform-default-environment/**

Monitor message consumption as an admin

Admins can view message consumption reporting in the Power Platform Admin Center

Foundry Models are available for standard deployment to a Foundry resource.

To learn more about attributes of Foundry Models sold directly by Azure, see Explore Foundry Models.

Foundry Models sold directly by Azure also include select models from top model providers, such as:

- Black Forest Labs: `FLUX.2-pro`, `FLUX.1-Kontext-pro`, `FLUX-1.1-pro`
- Cohere: `Cohere-command-a`, `embed-v-4-0`, `Cohere-rerank-v4.0-pro`, `Cohere-rerank-v4.0-fast`
- DeepSeek: `DeepSeek-V3.2`, `DeepSeek-V3.2-Speciale`, `DeepSeek-V3.1`, `DeepSeek-V3-0324`, `DeepSeek-R1-0528`, `DeepSeek-R1`
- Moonshot AI: `Kimi-K2-Thinking`
- Meta: `Llama-4-Maverick-17B-128E-Instruct-FP8`, `Llama-3.3-70B-Instruct`
- Microsoft: `MAI-DS-R1`, `model-router`
- Mistral: `mistral-document-ai-2505`, `Mistral-Large-3`
- xAI: `grok-code-fast-1`, `grok-3`, `grok-3-mini`, `grok-4-fast-reasoning`, `grok-4-fast-non-reasoning`, `grok-4`

To learn about these models, switch to Other model collections at the top of this article.

Azure OpenAI in Microsoft Foundry models

Multi-Agents with Agent flow

Let's build a Microsoft Bot to handle support requests

In this Lab you will build a set of agents that work together to process support requests

Agent 1: Listens for emails and calls 2 other to ask:

- Is this support related and
- what is the best answer according to Microsoft

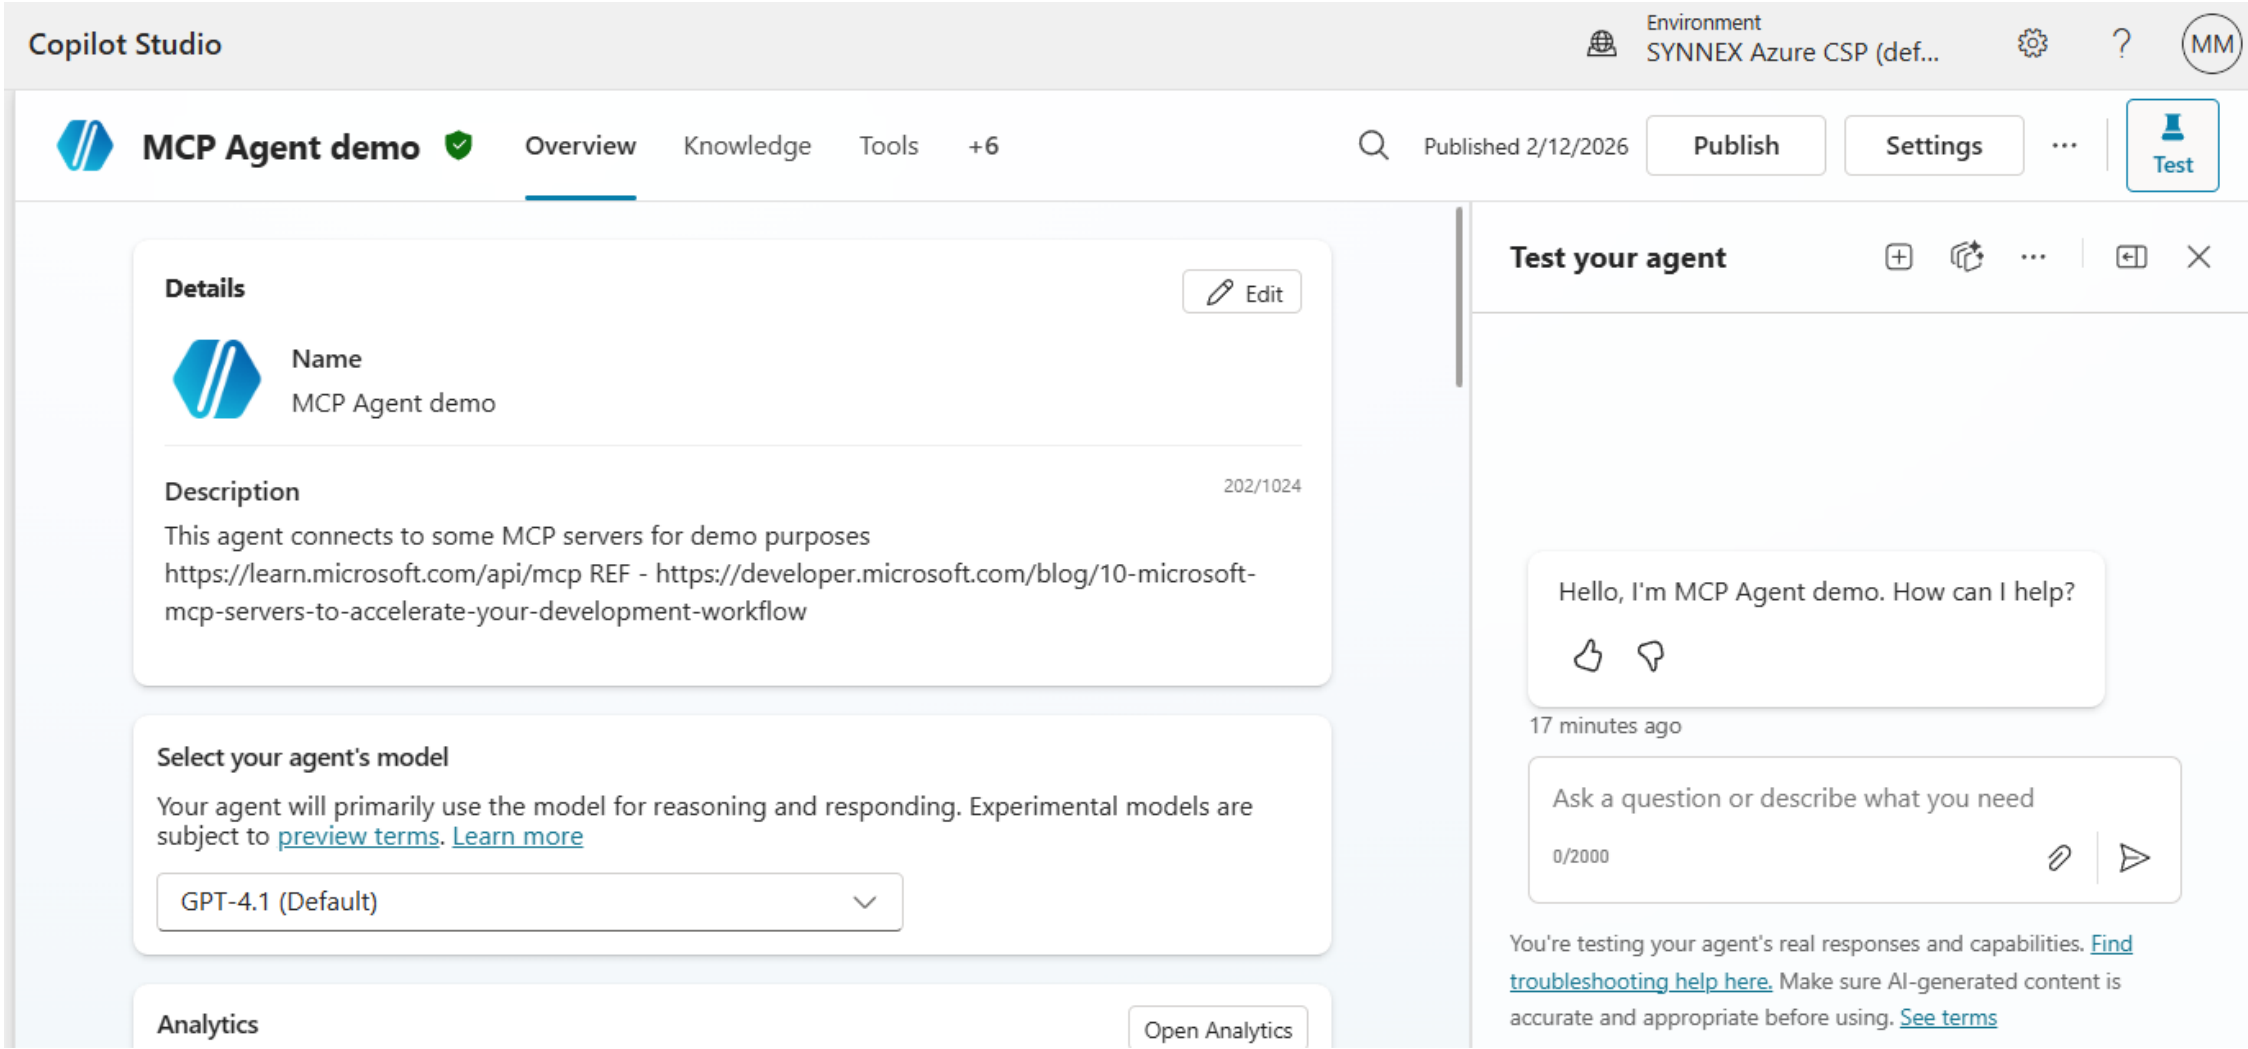

Agent 2: Parses an email body to strip 'garbage'

Agent 3: Calls Microsoft Learn MCP server for the most up-to-date answer.

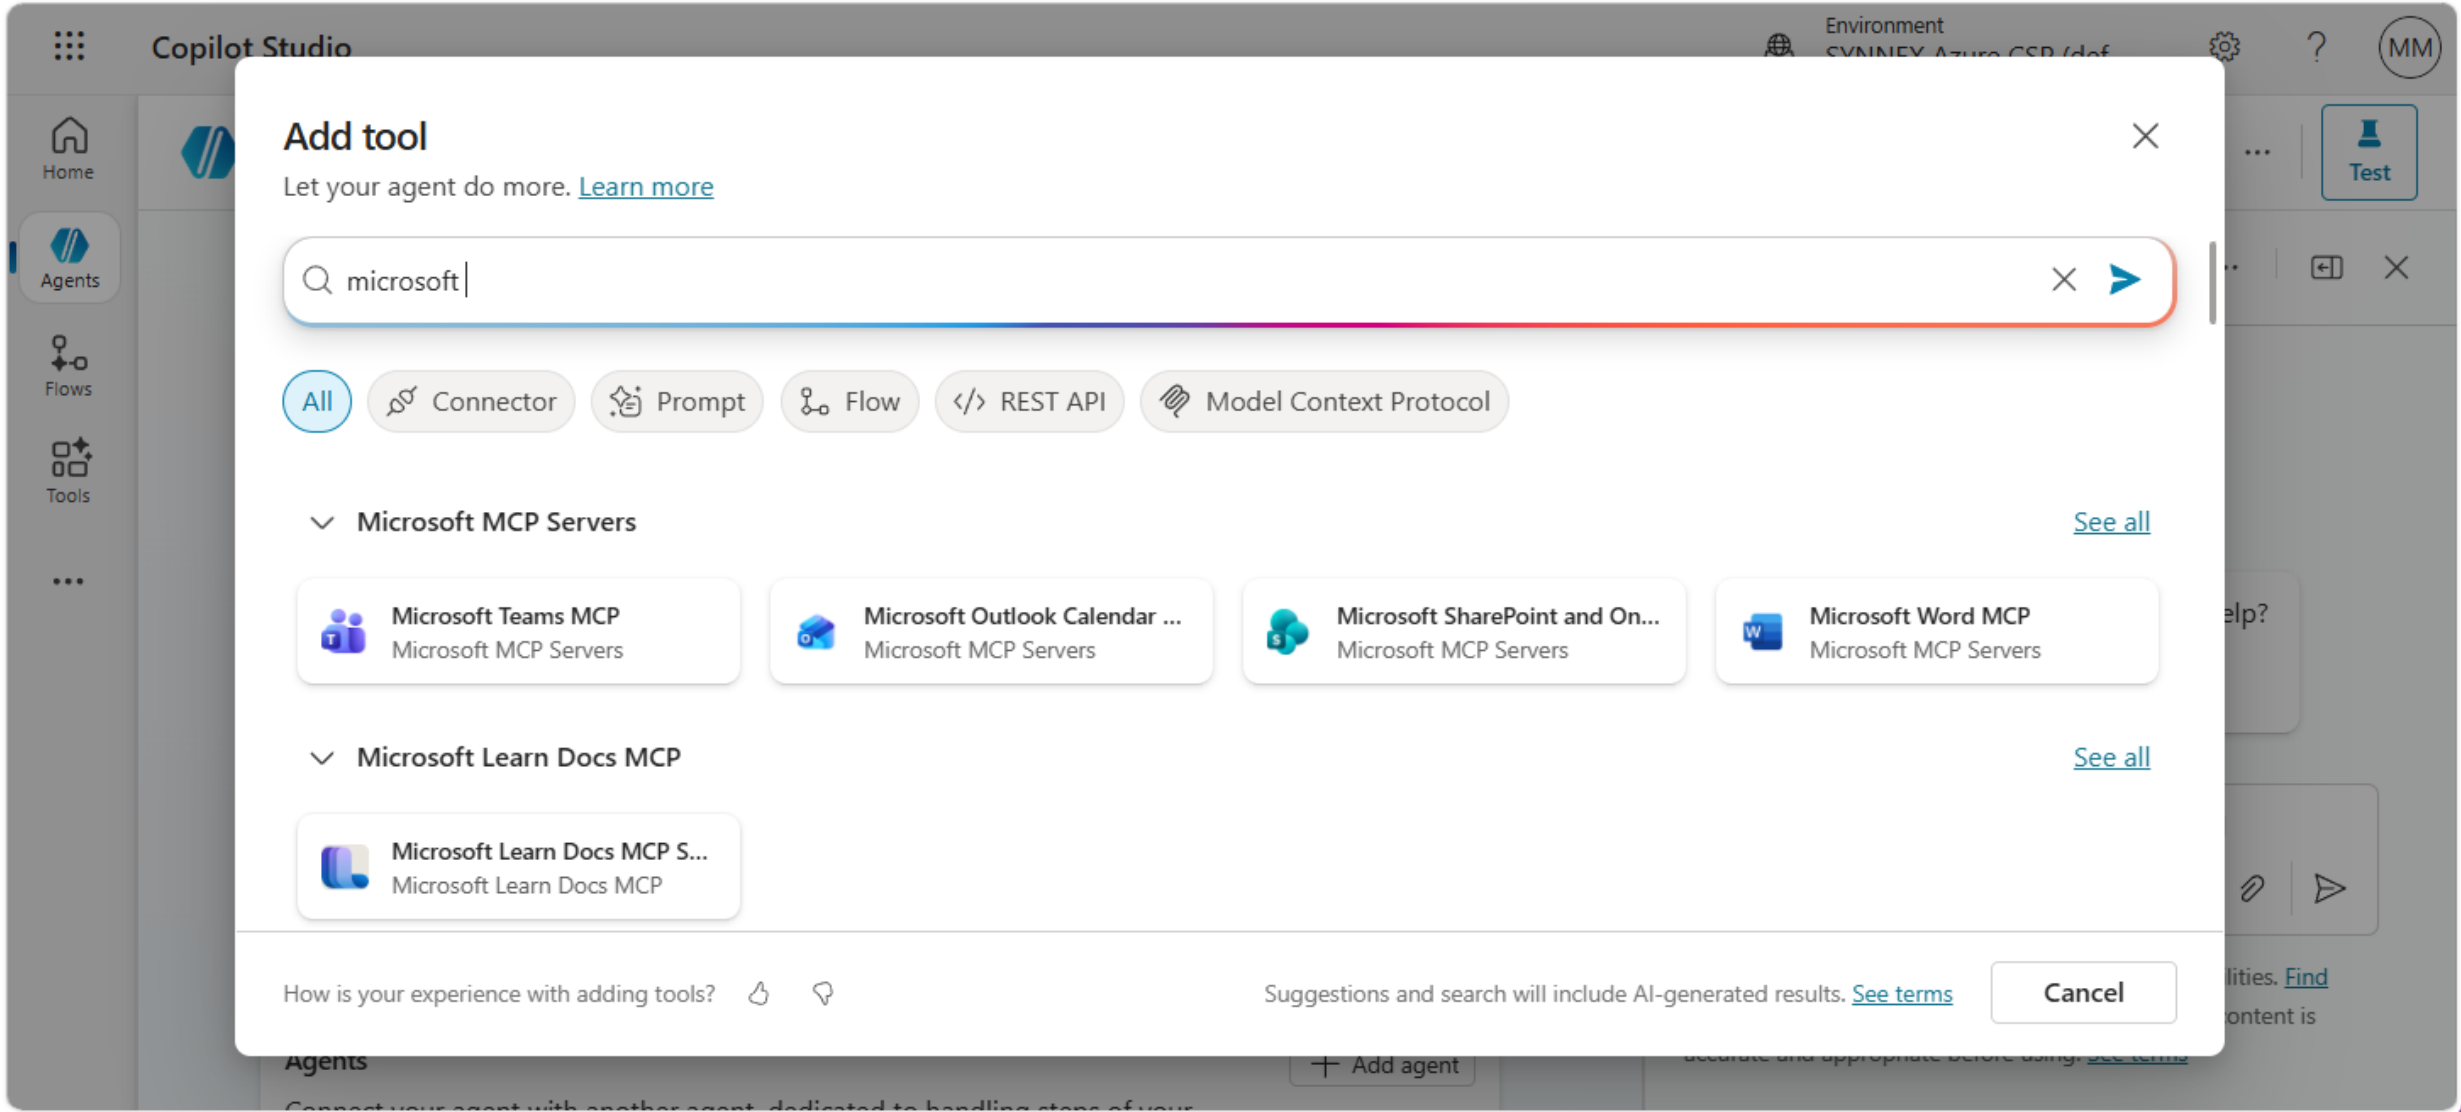

https://learn.microsoft.com/api/mcp

REF - https://developer.microsoft.com/blog/10-microsoft-mcp-servers-to-accelerate-your-development-workflow

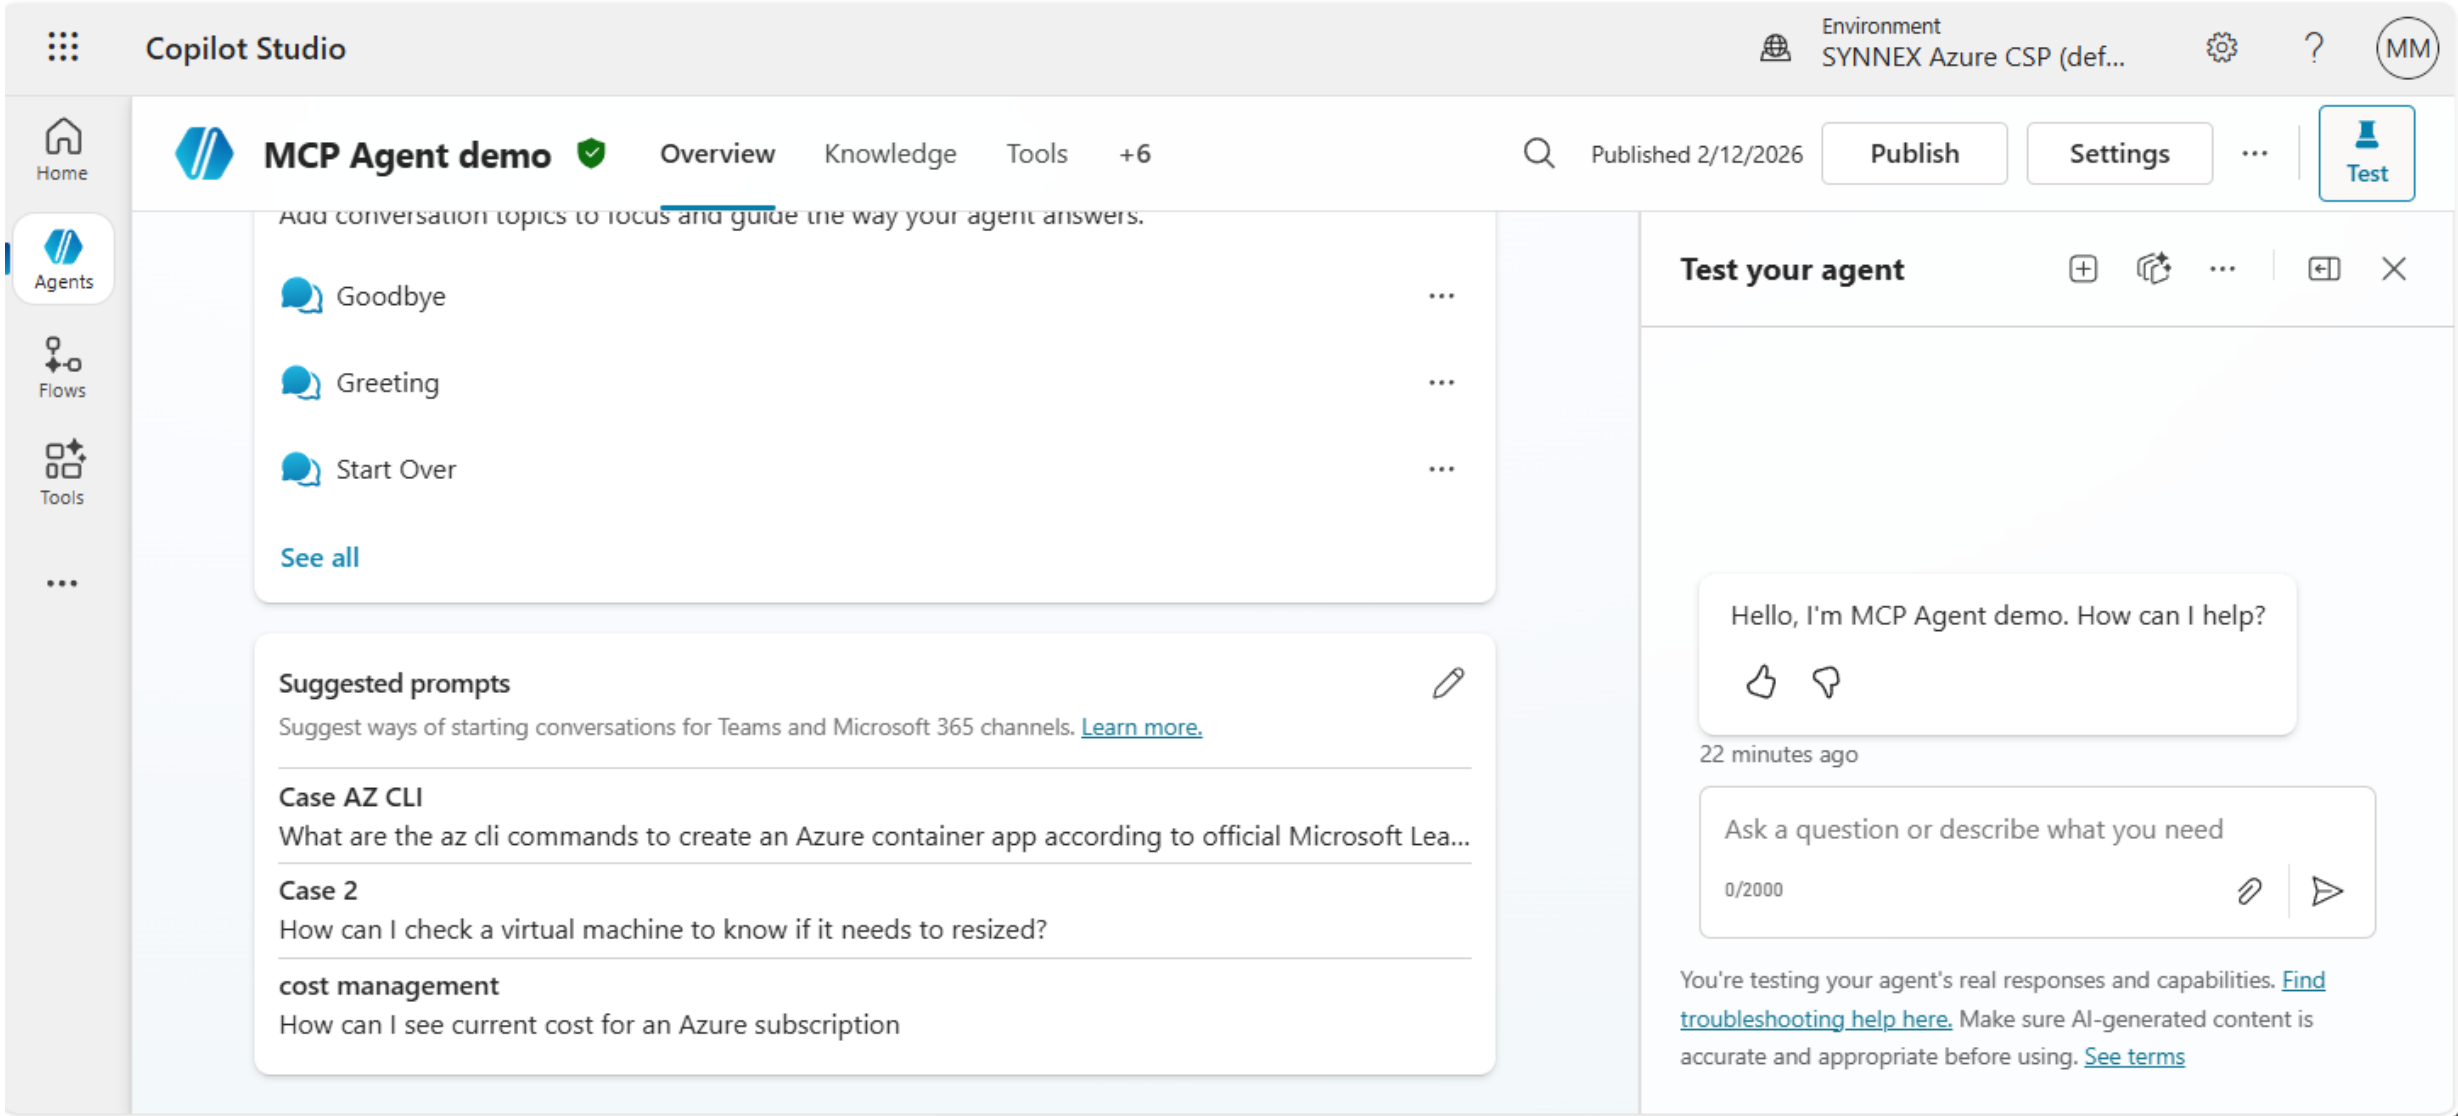

Agent 1 - Create new agent and name and describe

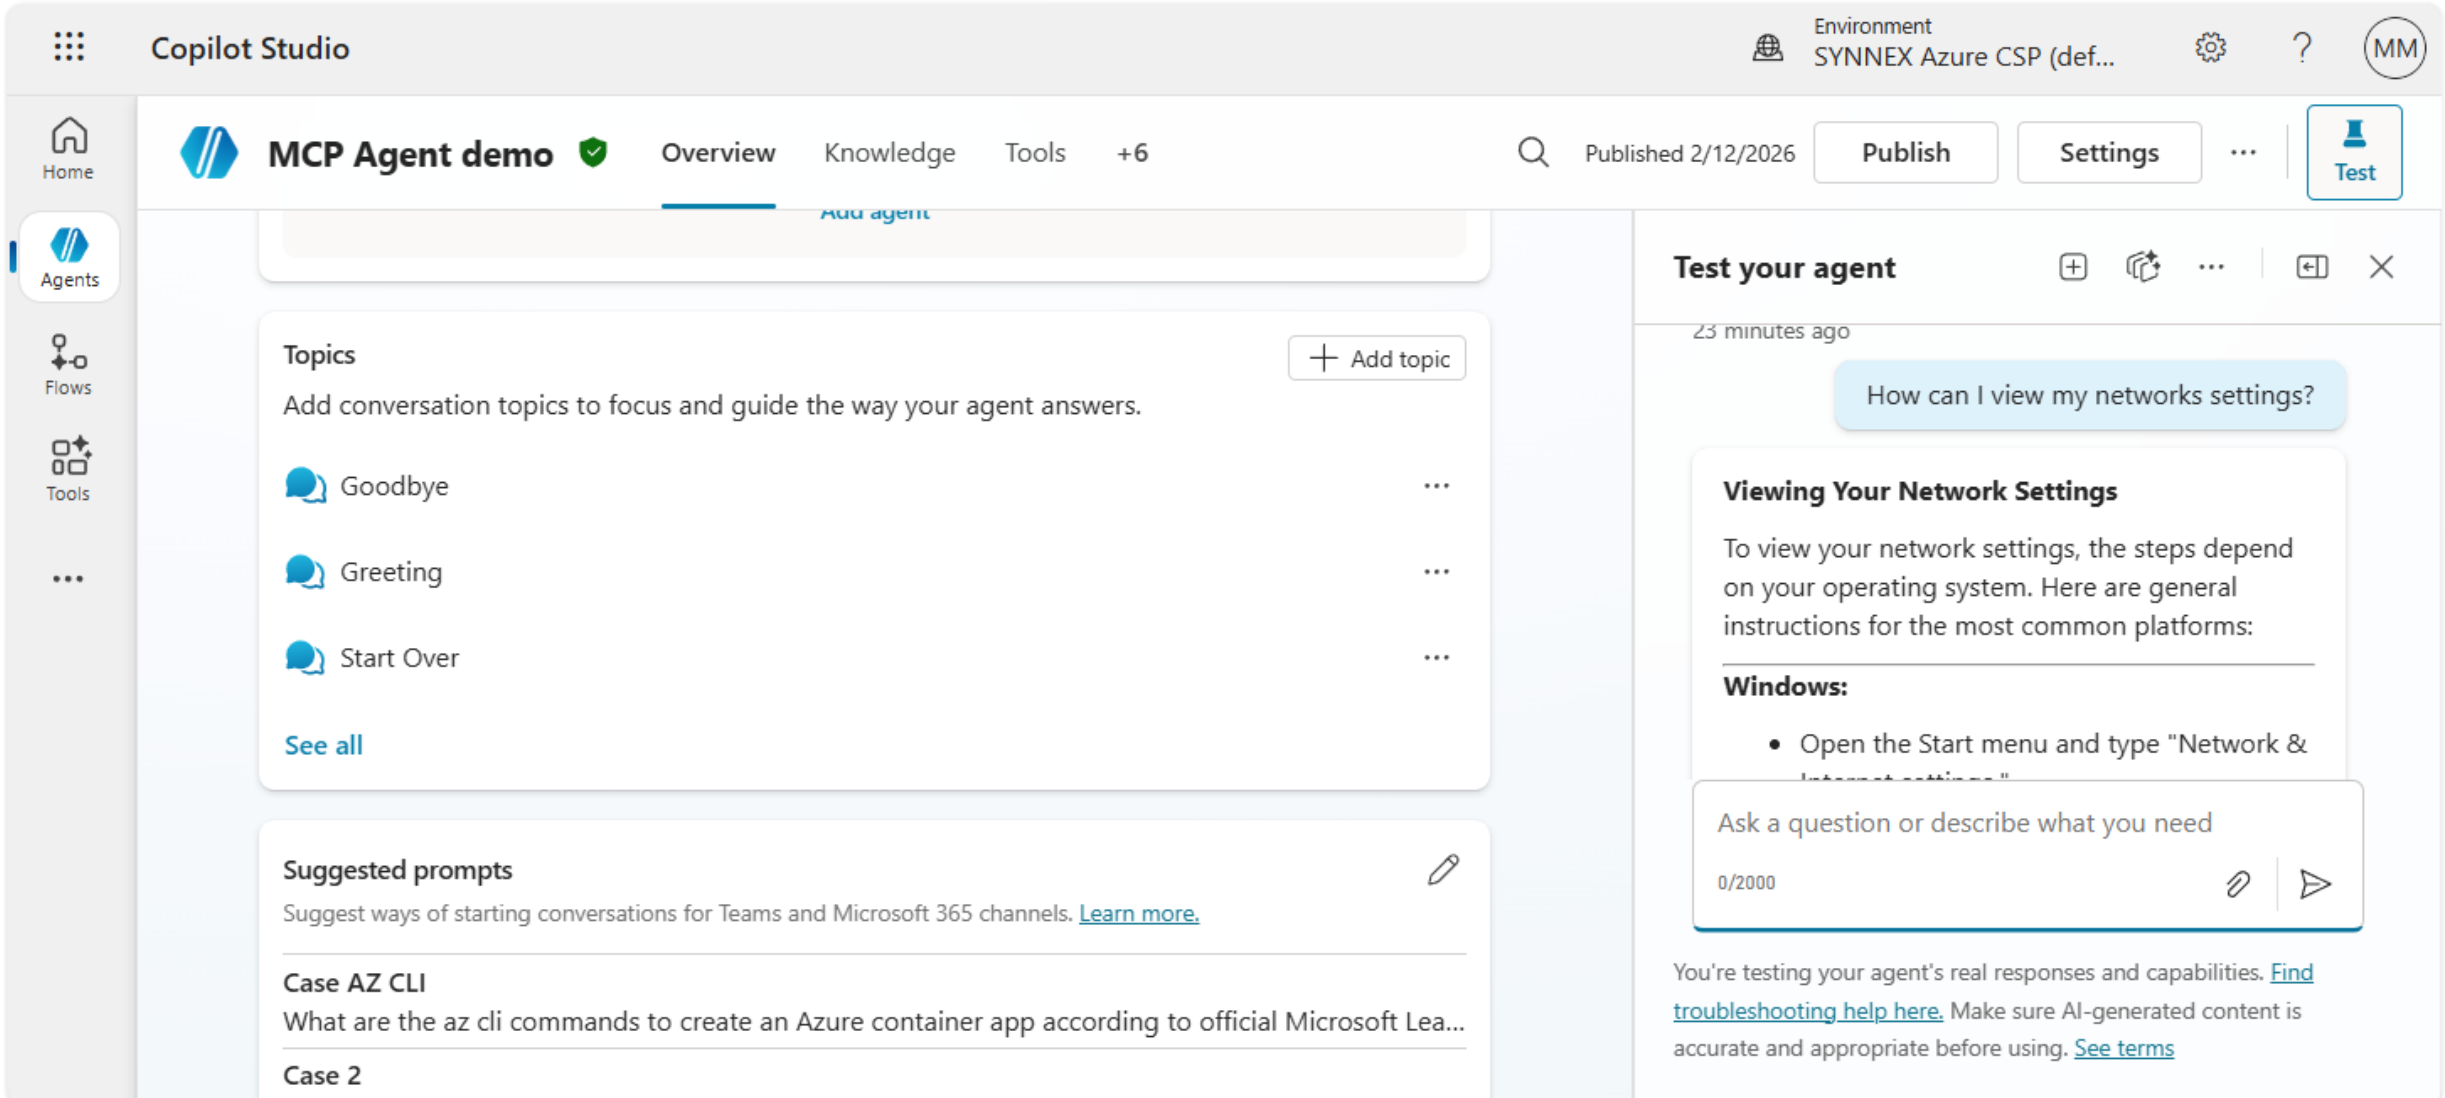

Add tool for "Microsoft Learn Docs MCP Server"

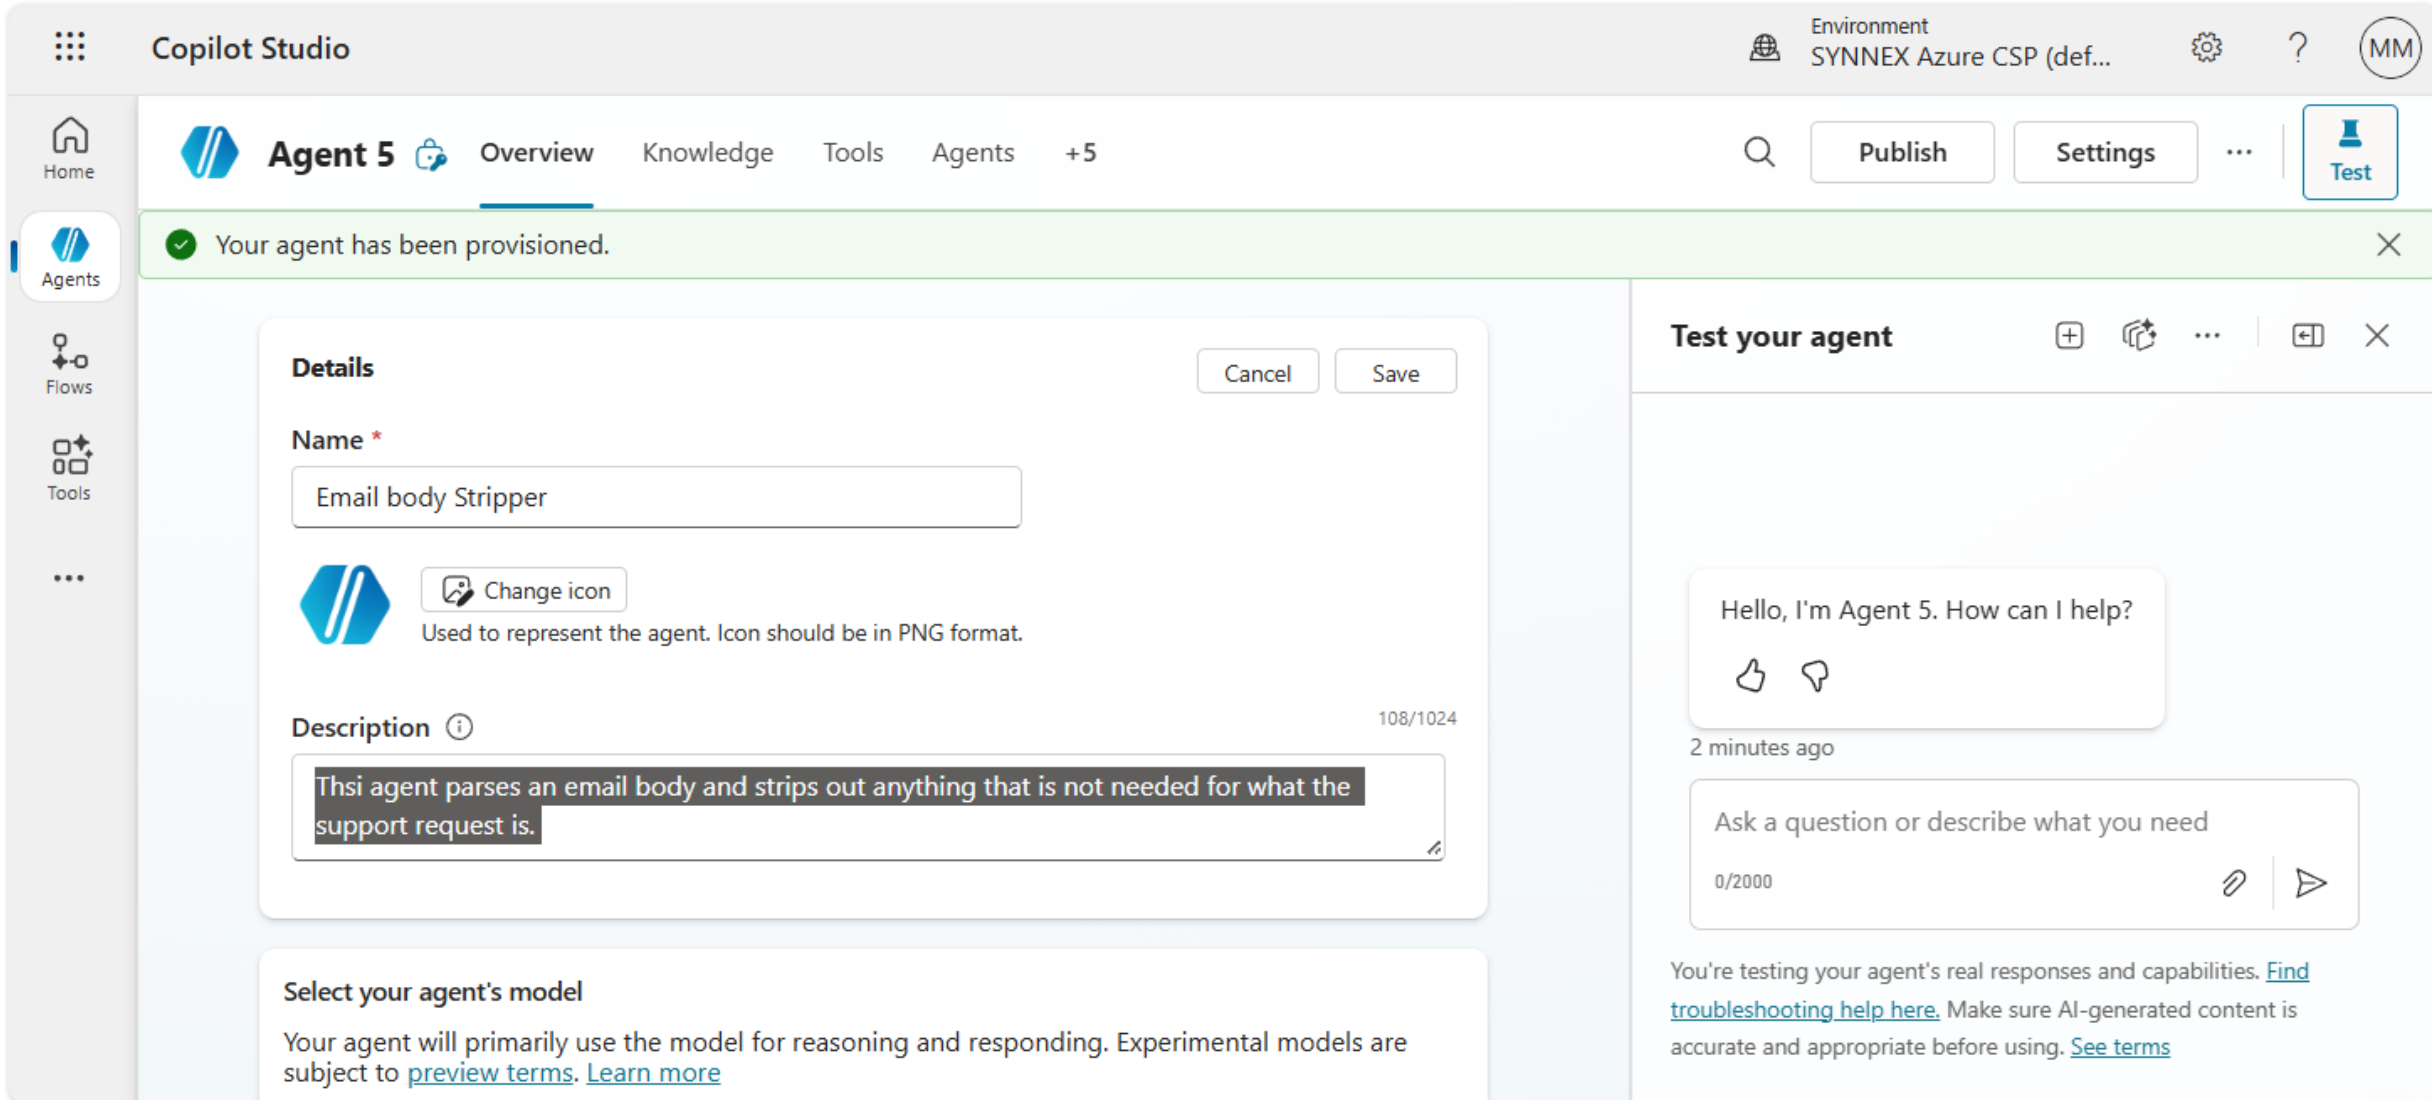

Add Suggested Prompts – *note, these don't display in dev-mode*

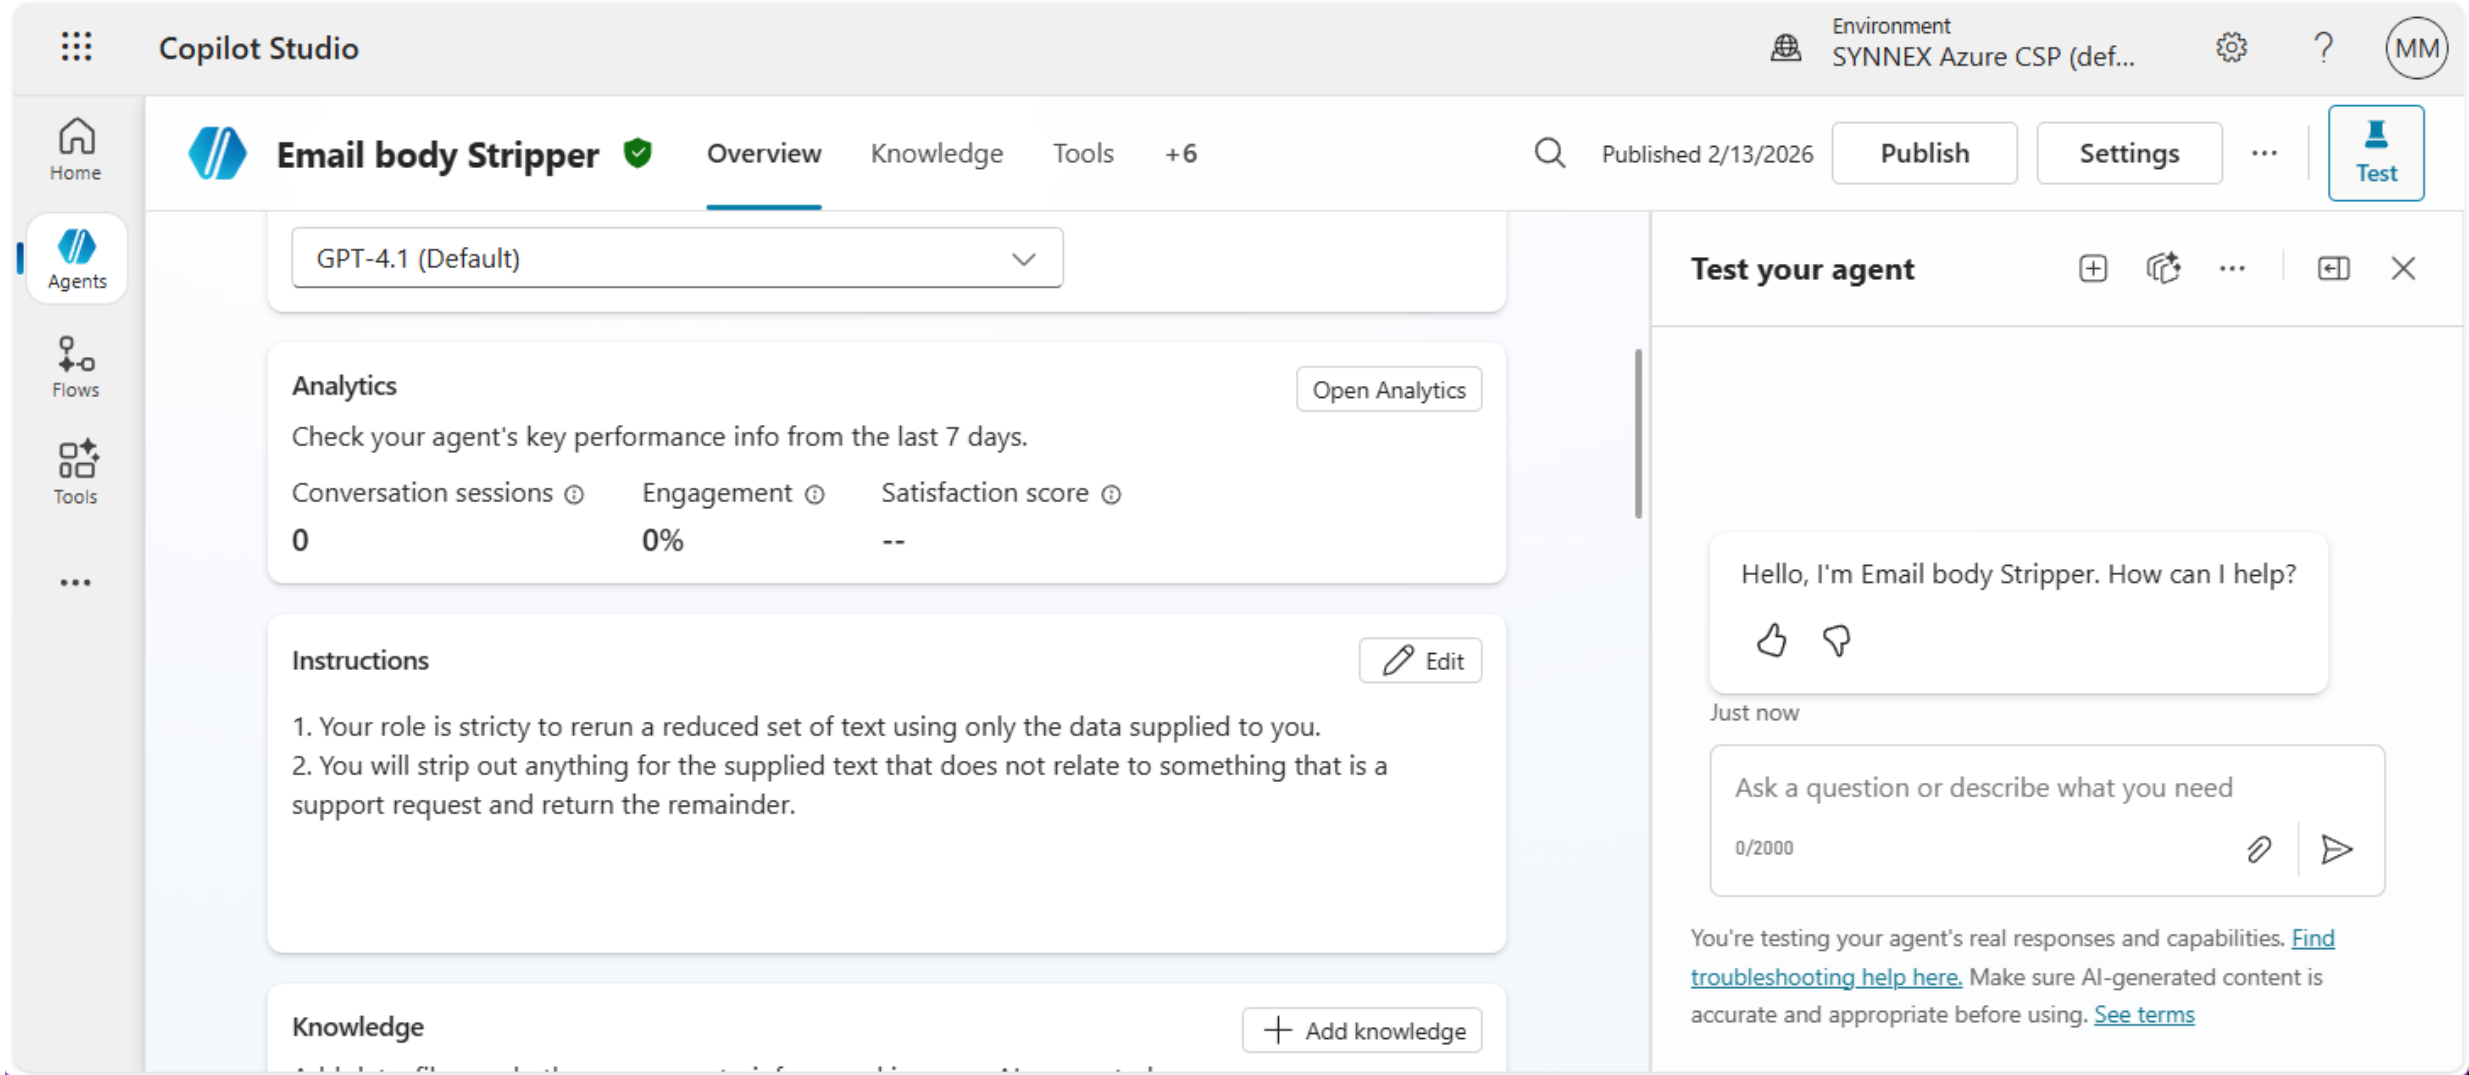

Test and publish the agent

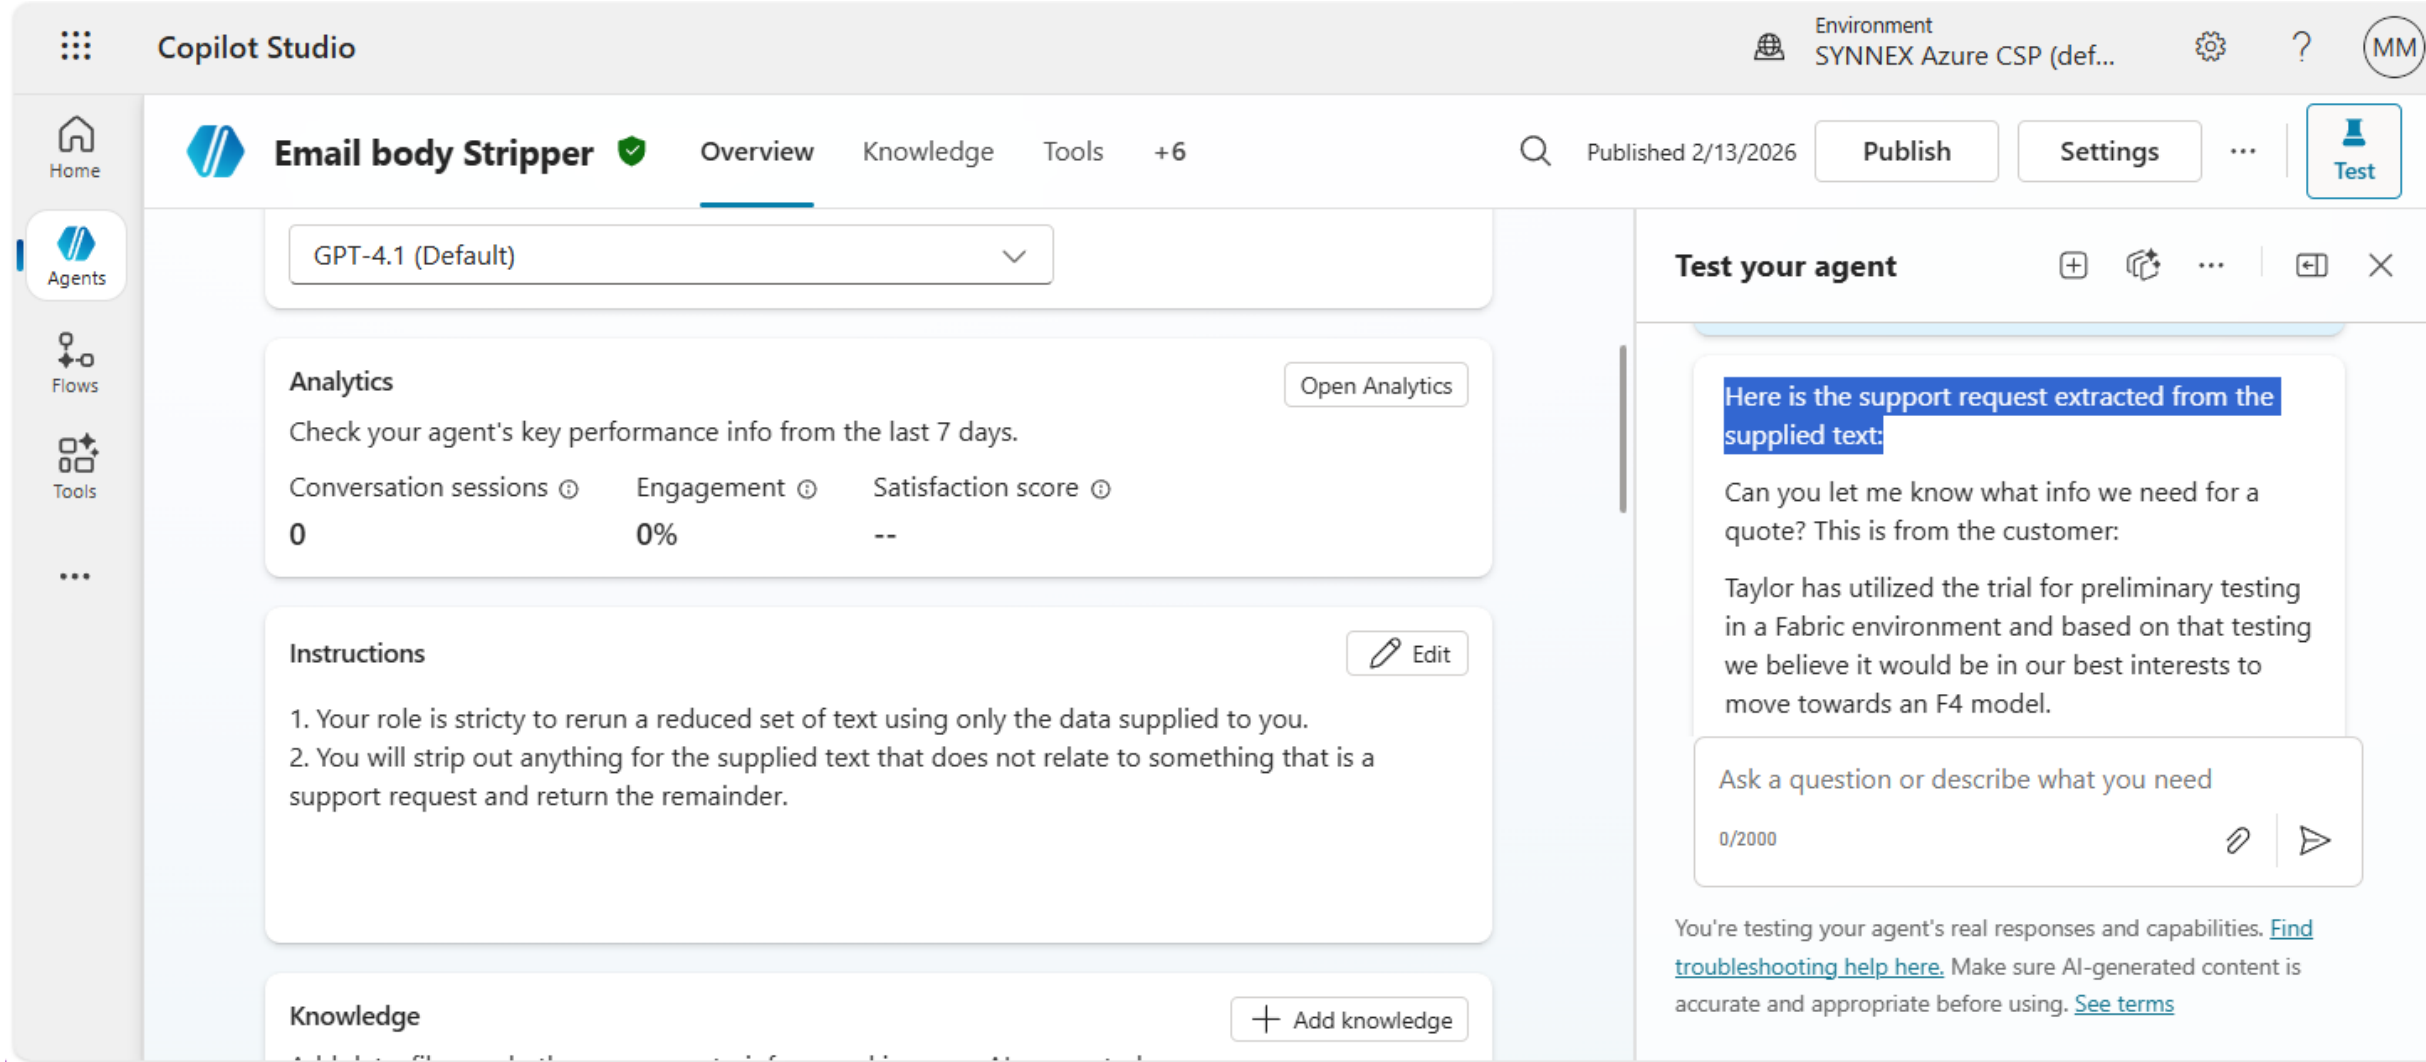

Agent 2 – Create new agent Email body parser – *pulling out the trash*

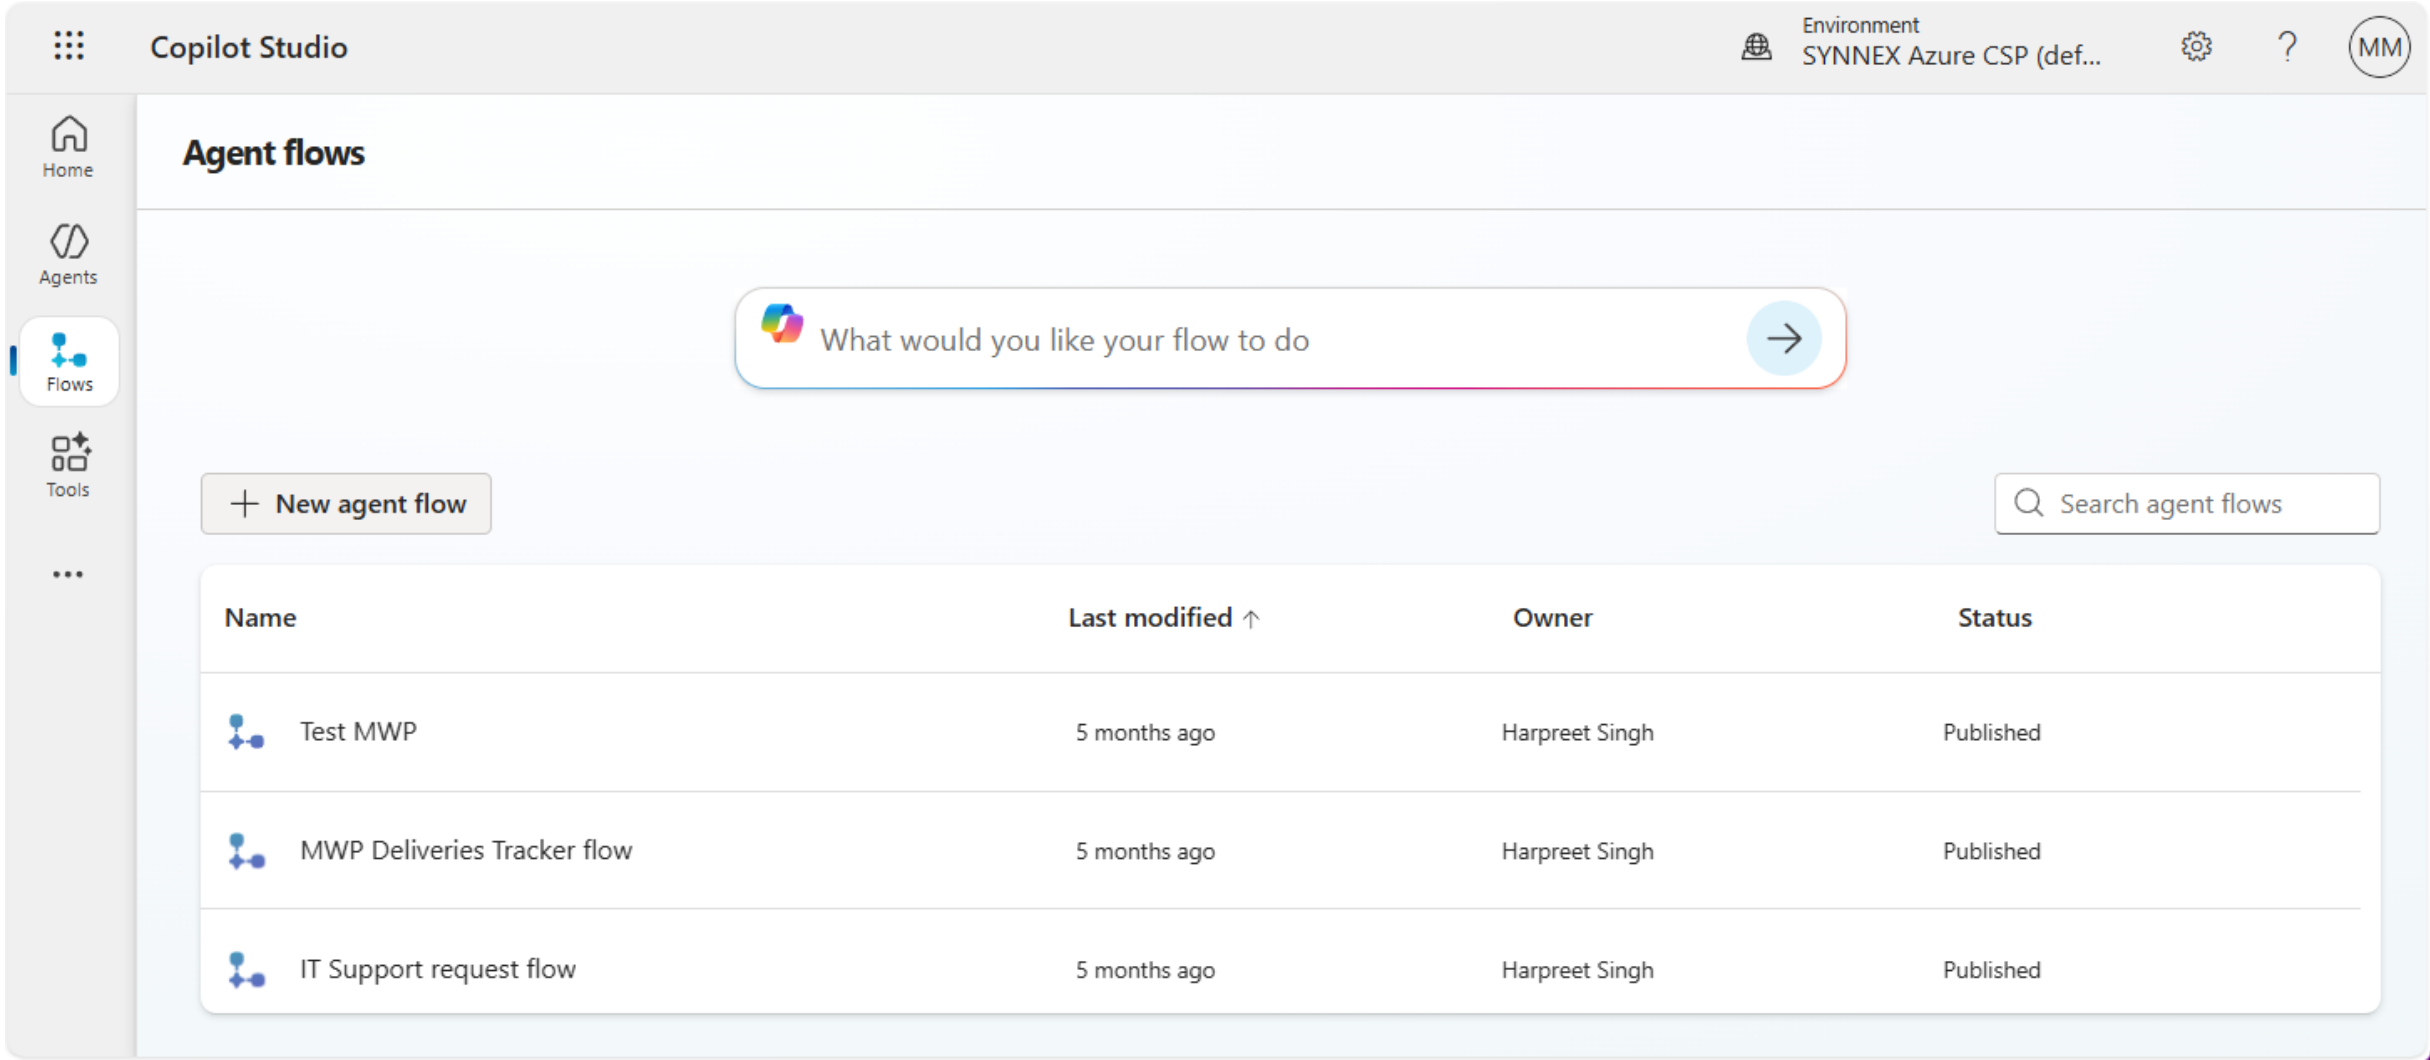

Define Instructions

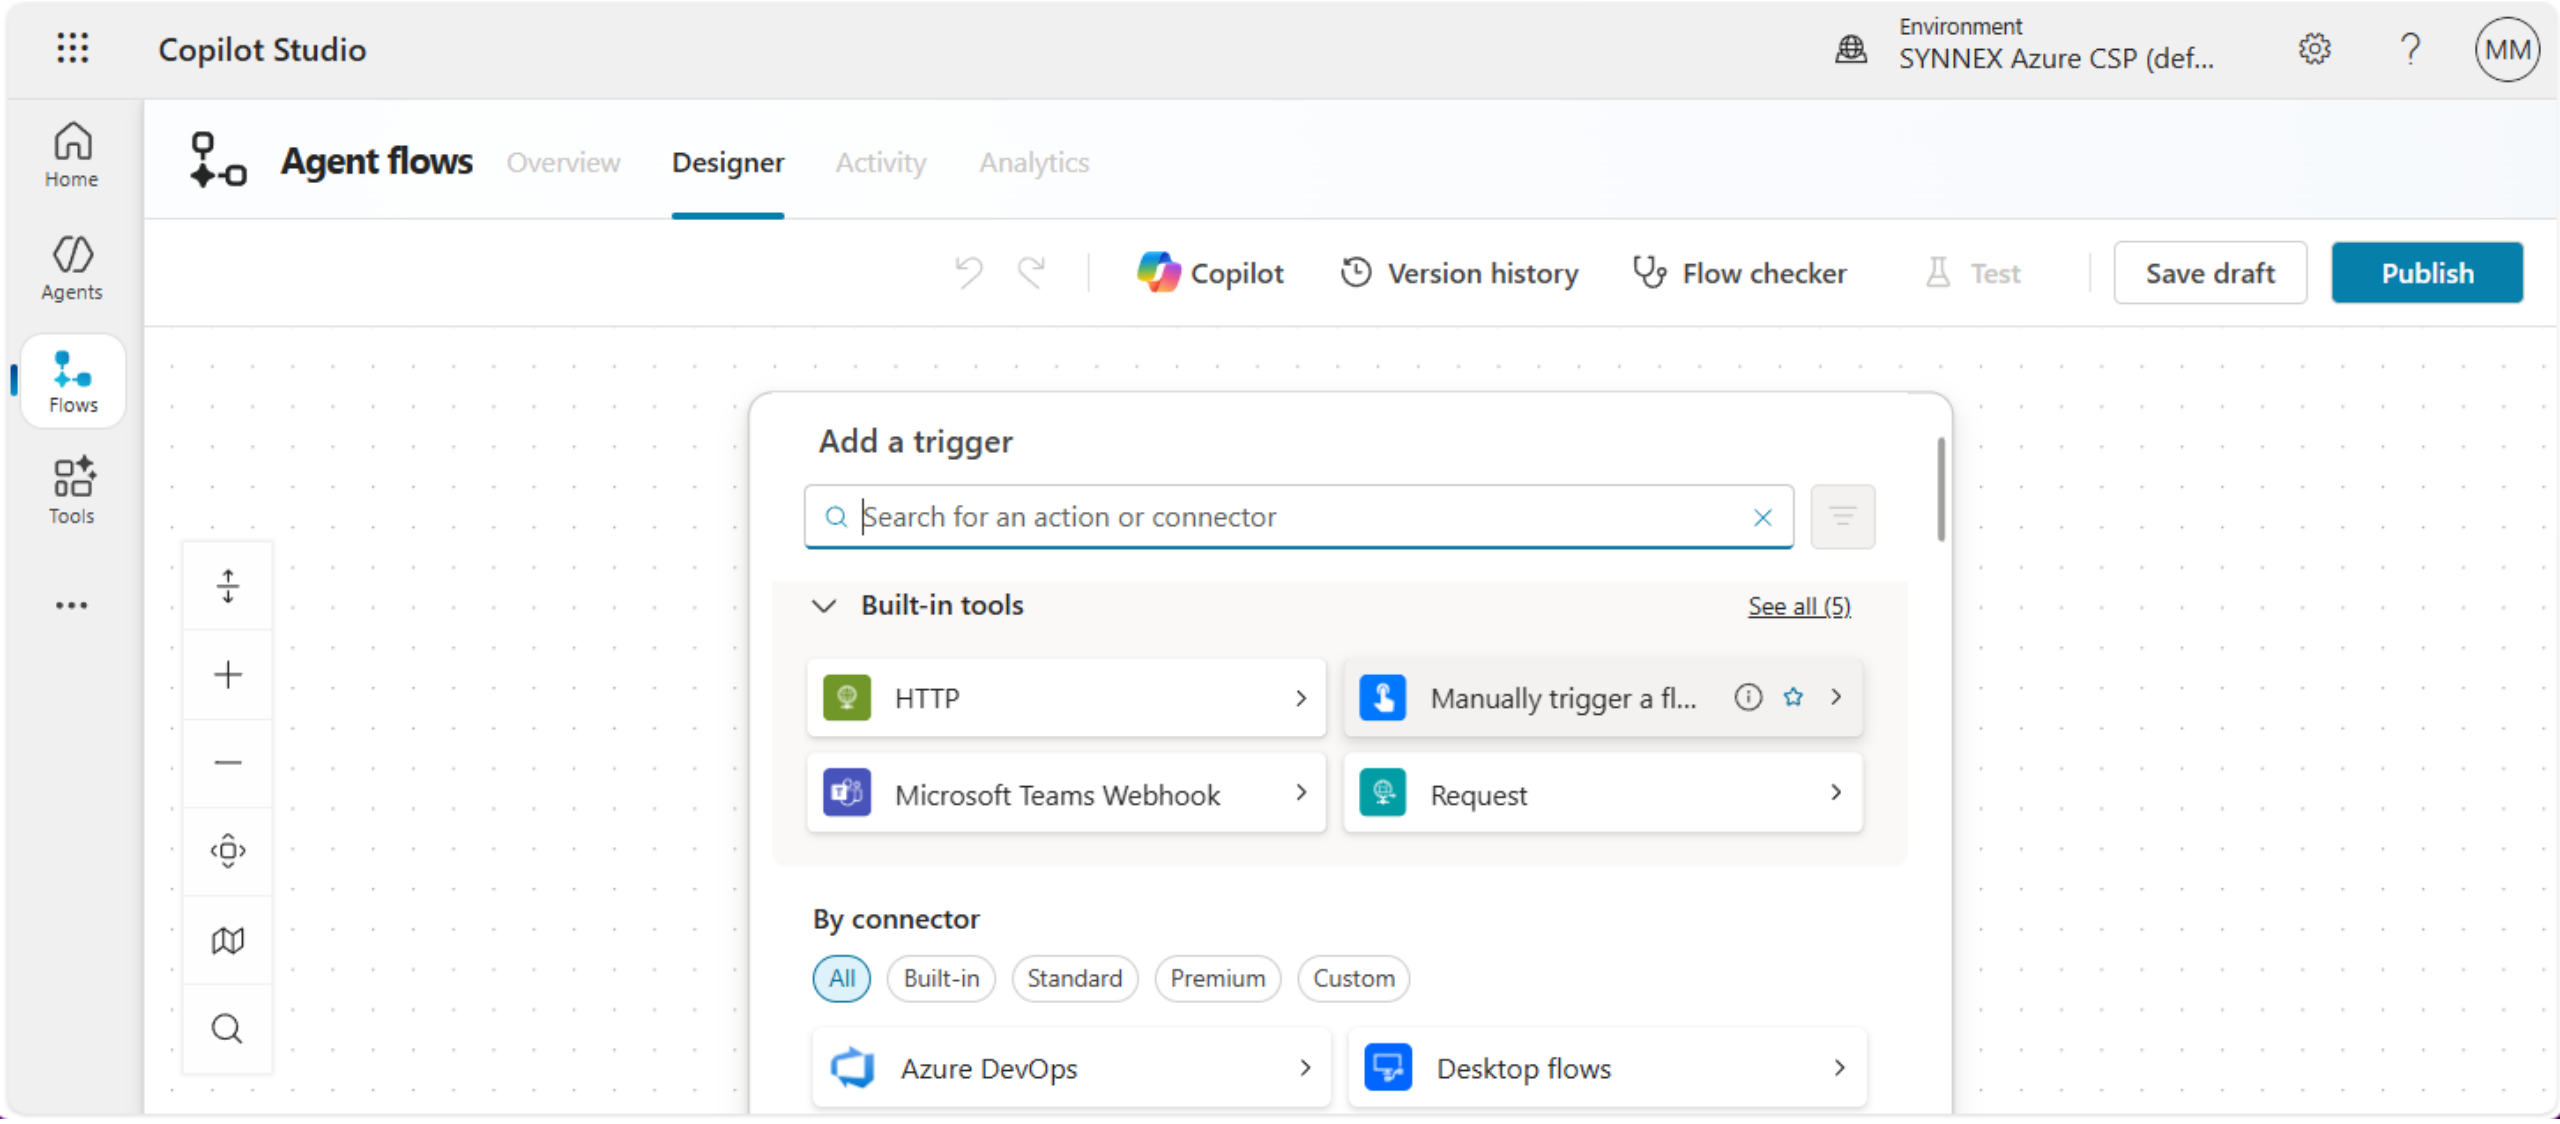

Publish & Test stripper Agents

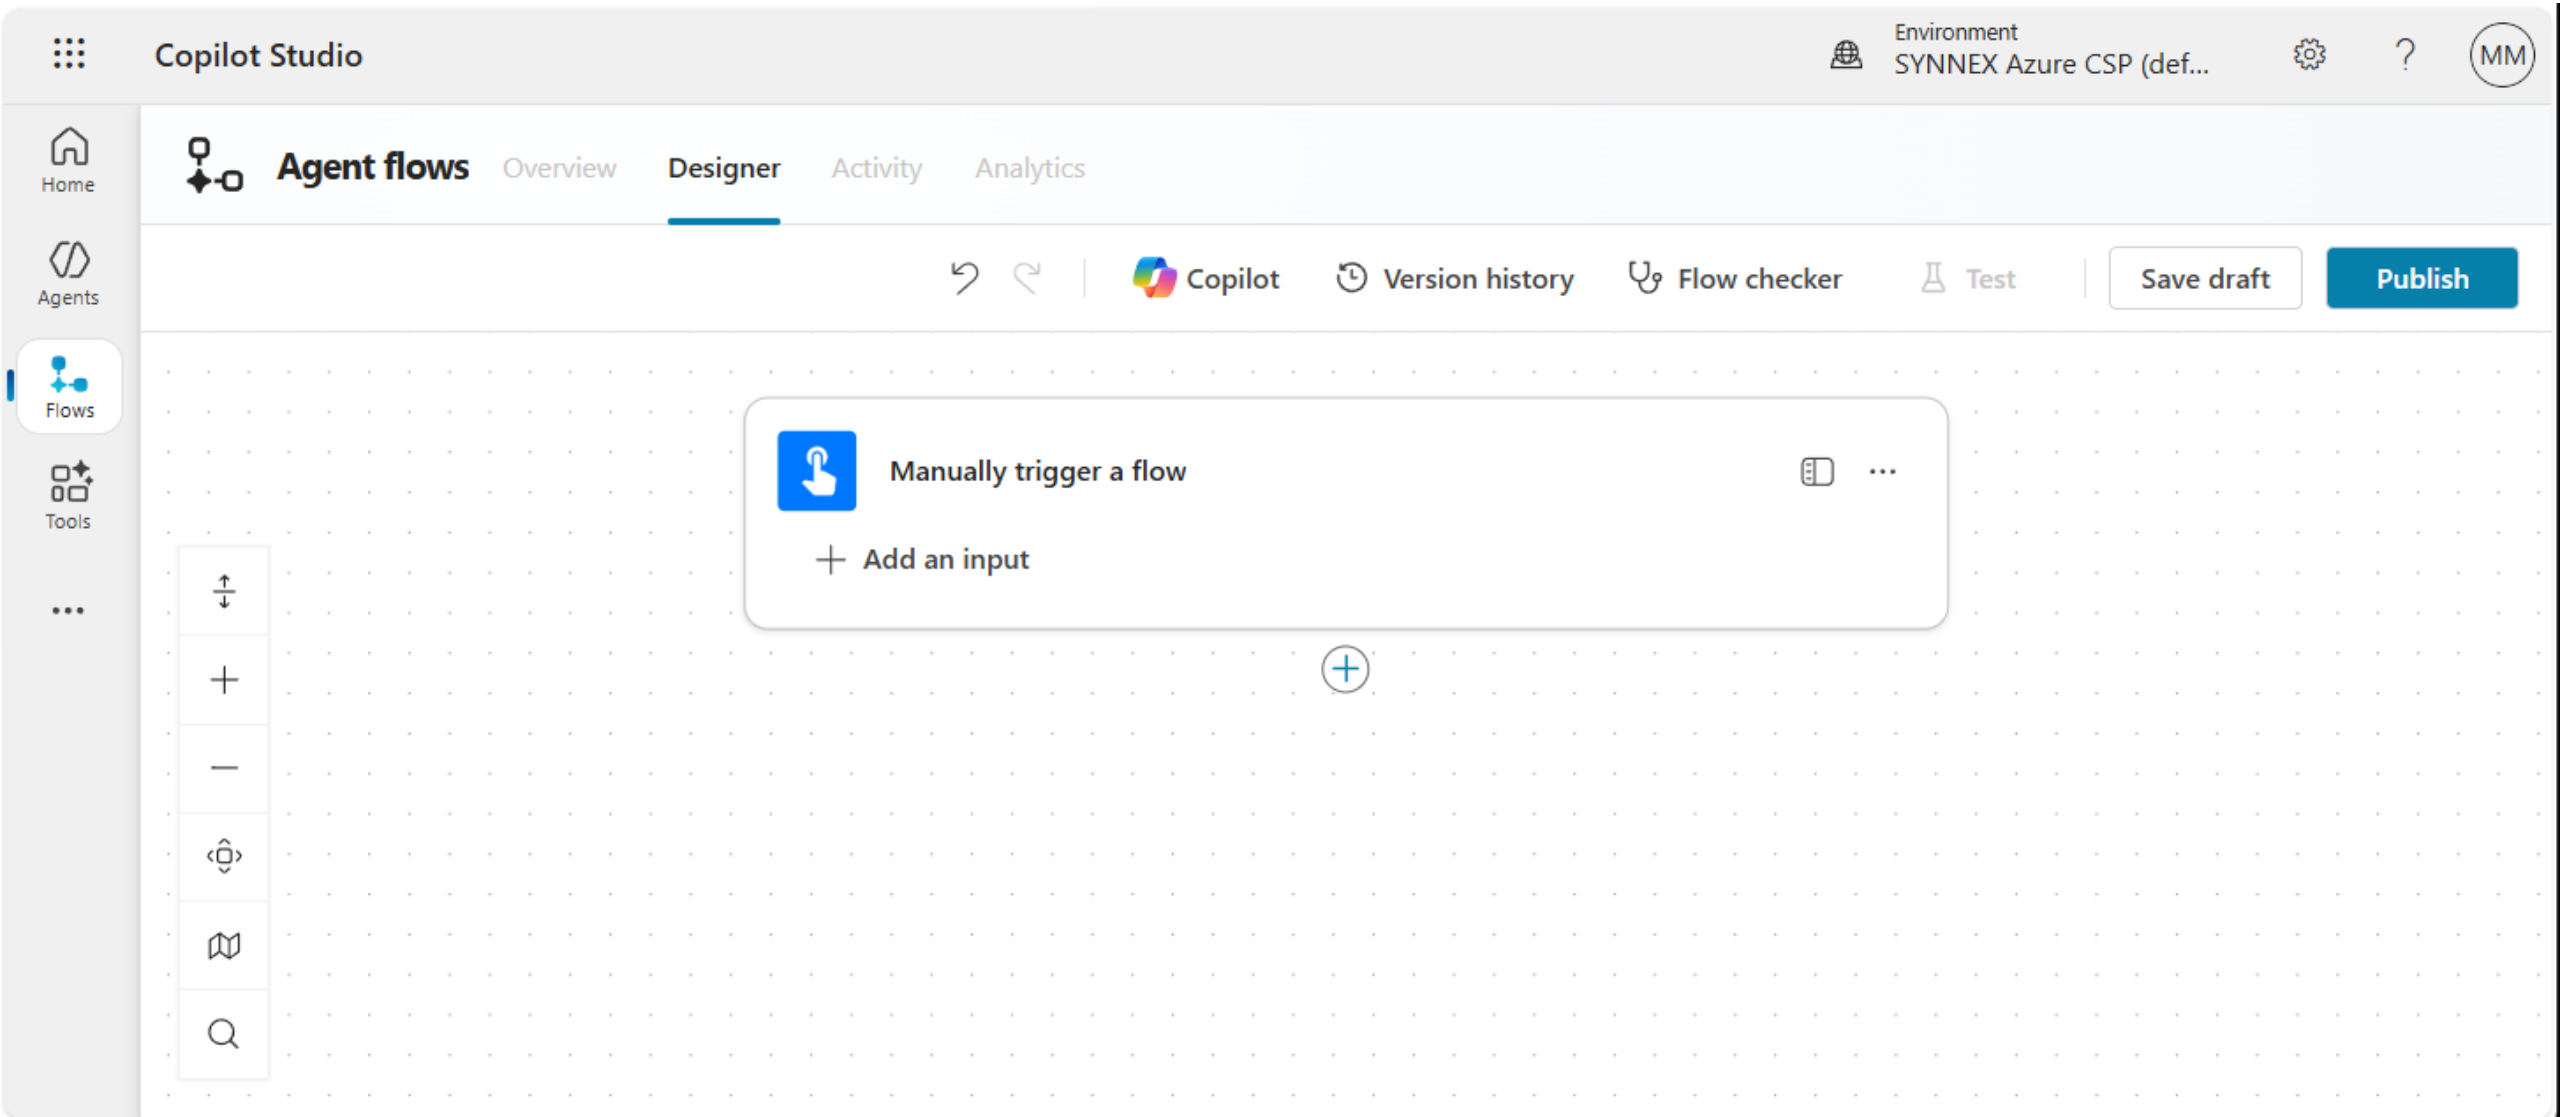

Create an Agent flow

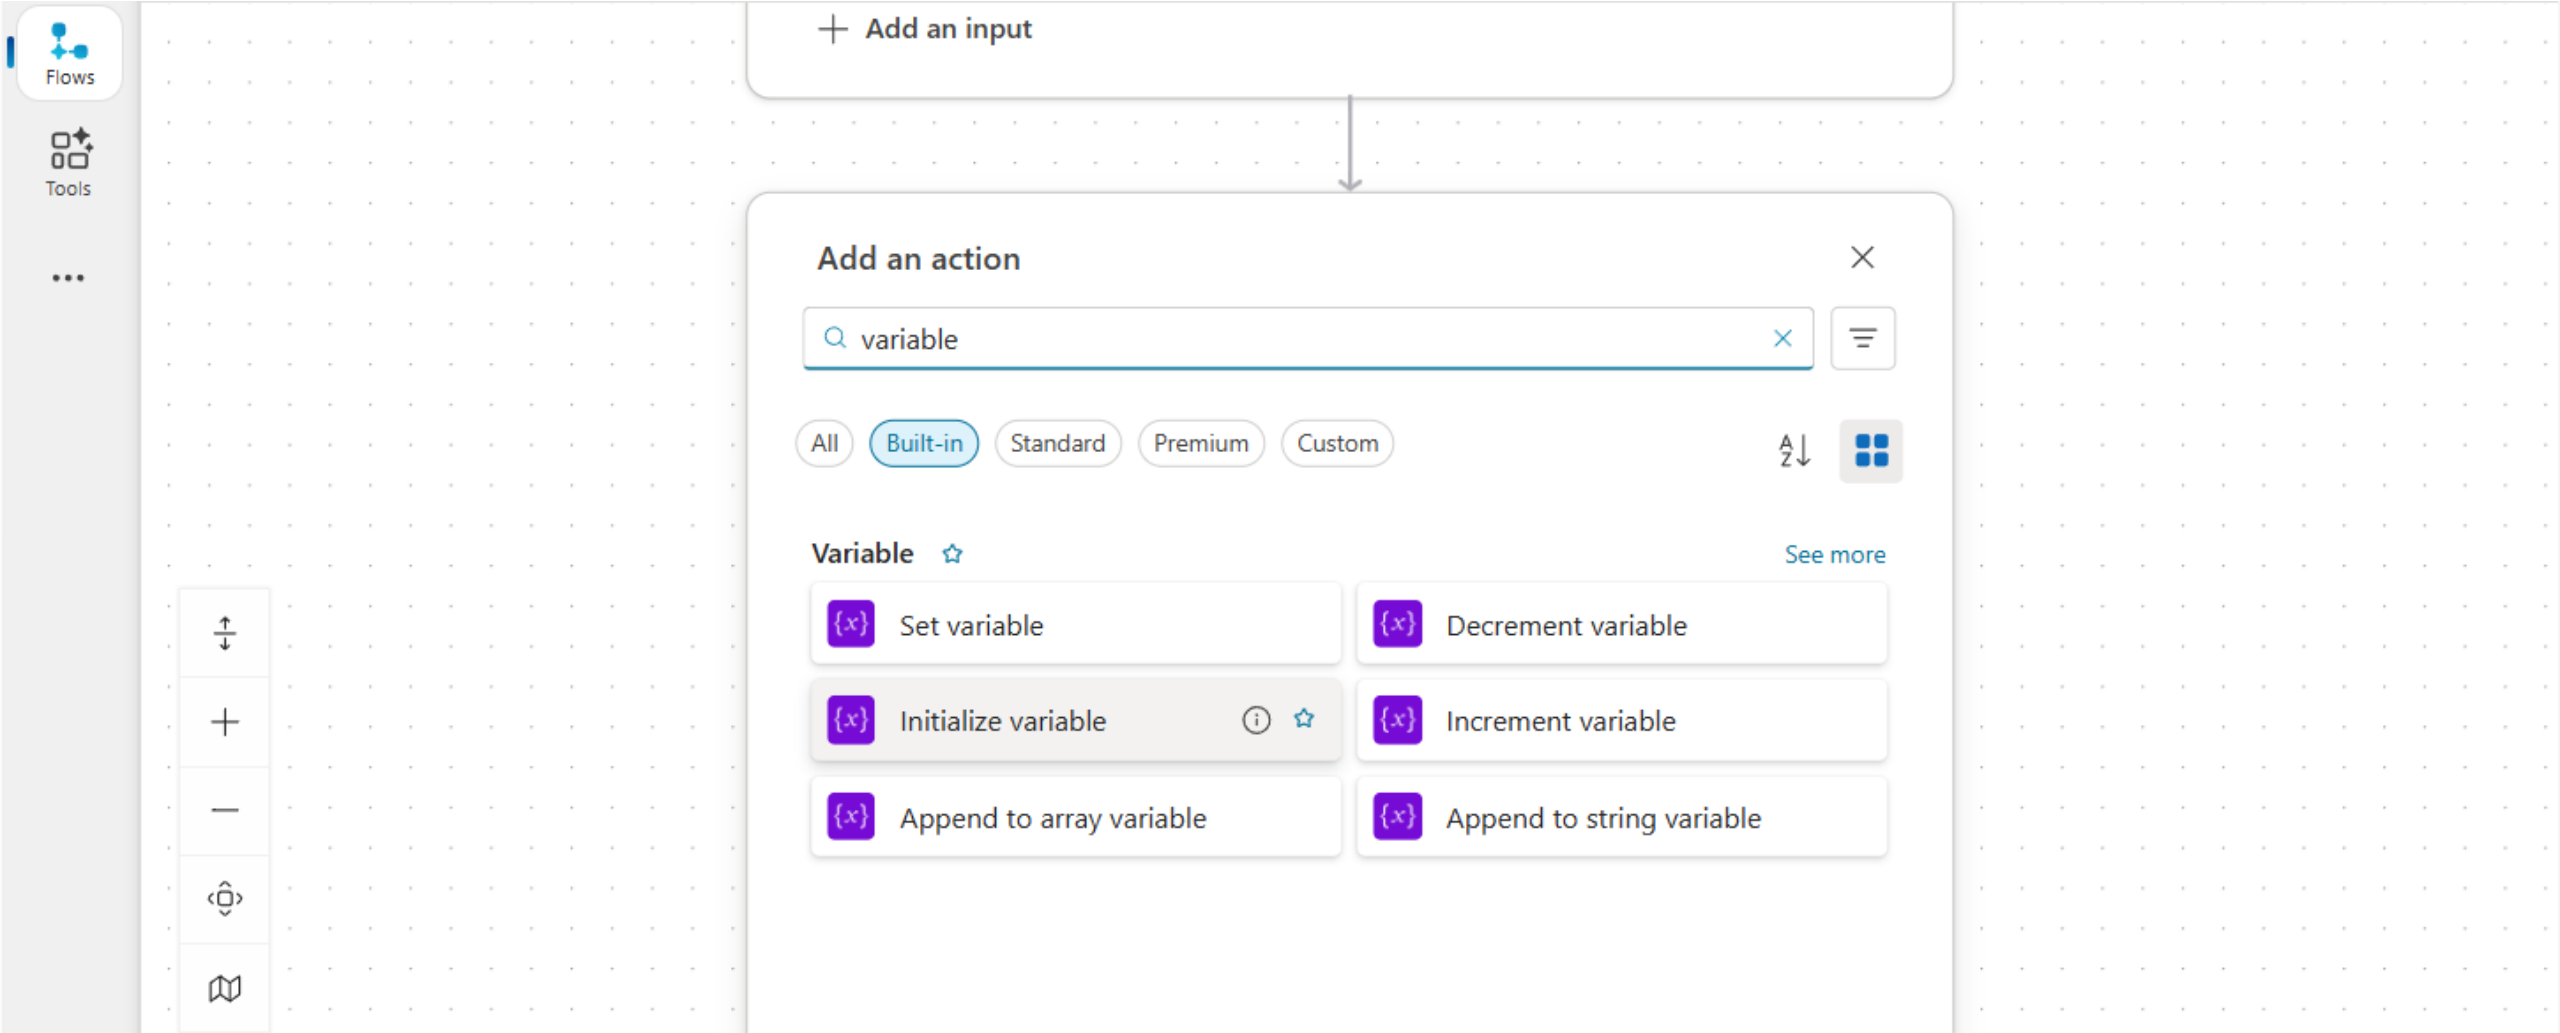

Add “Manually trigger a flow”

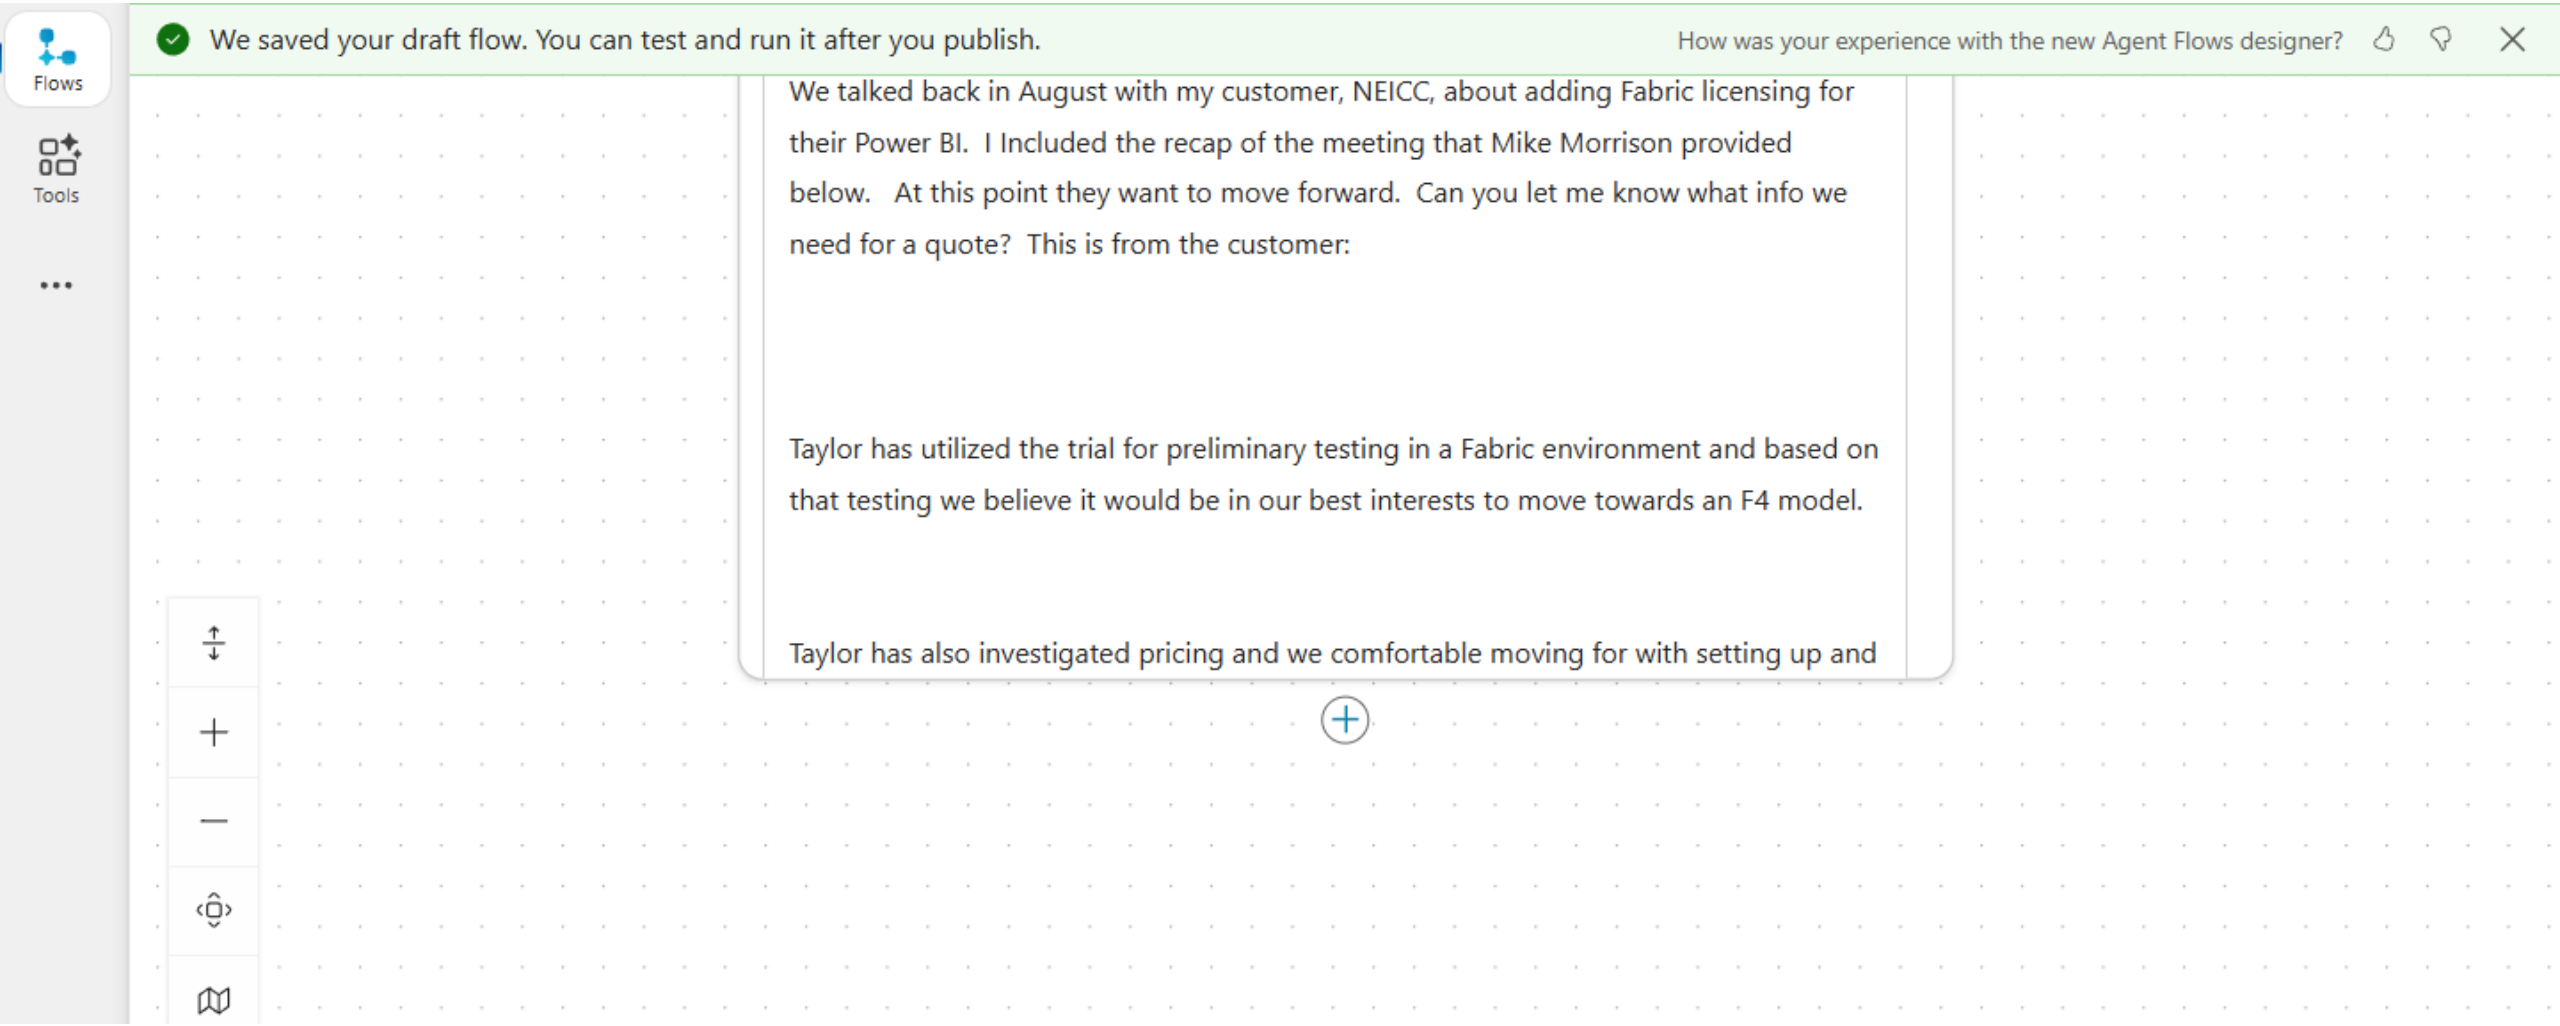

Multi-Agents with Agent flow

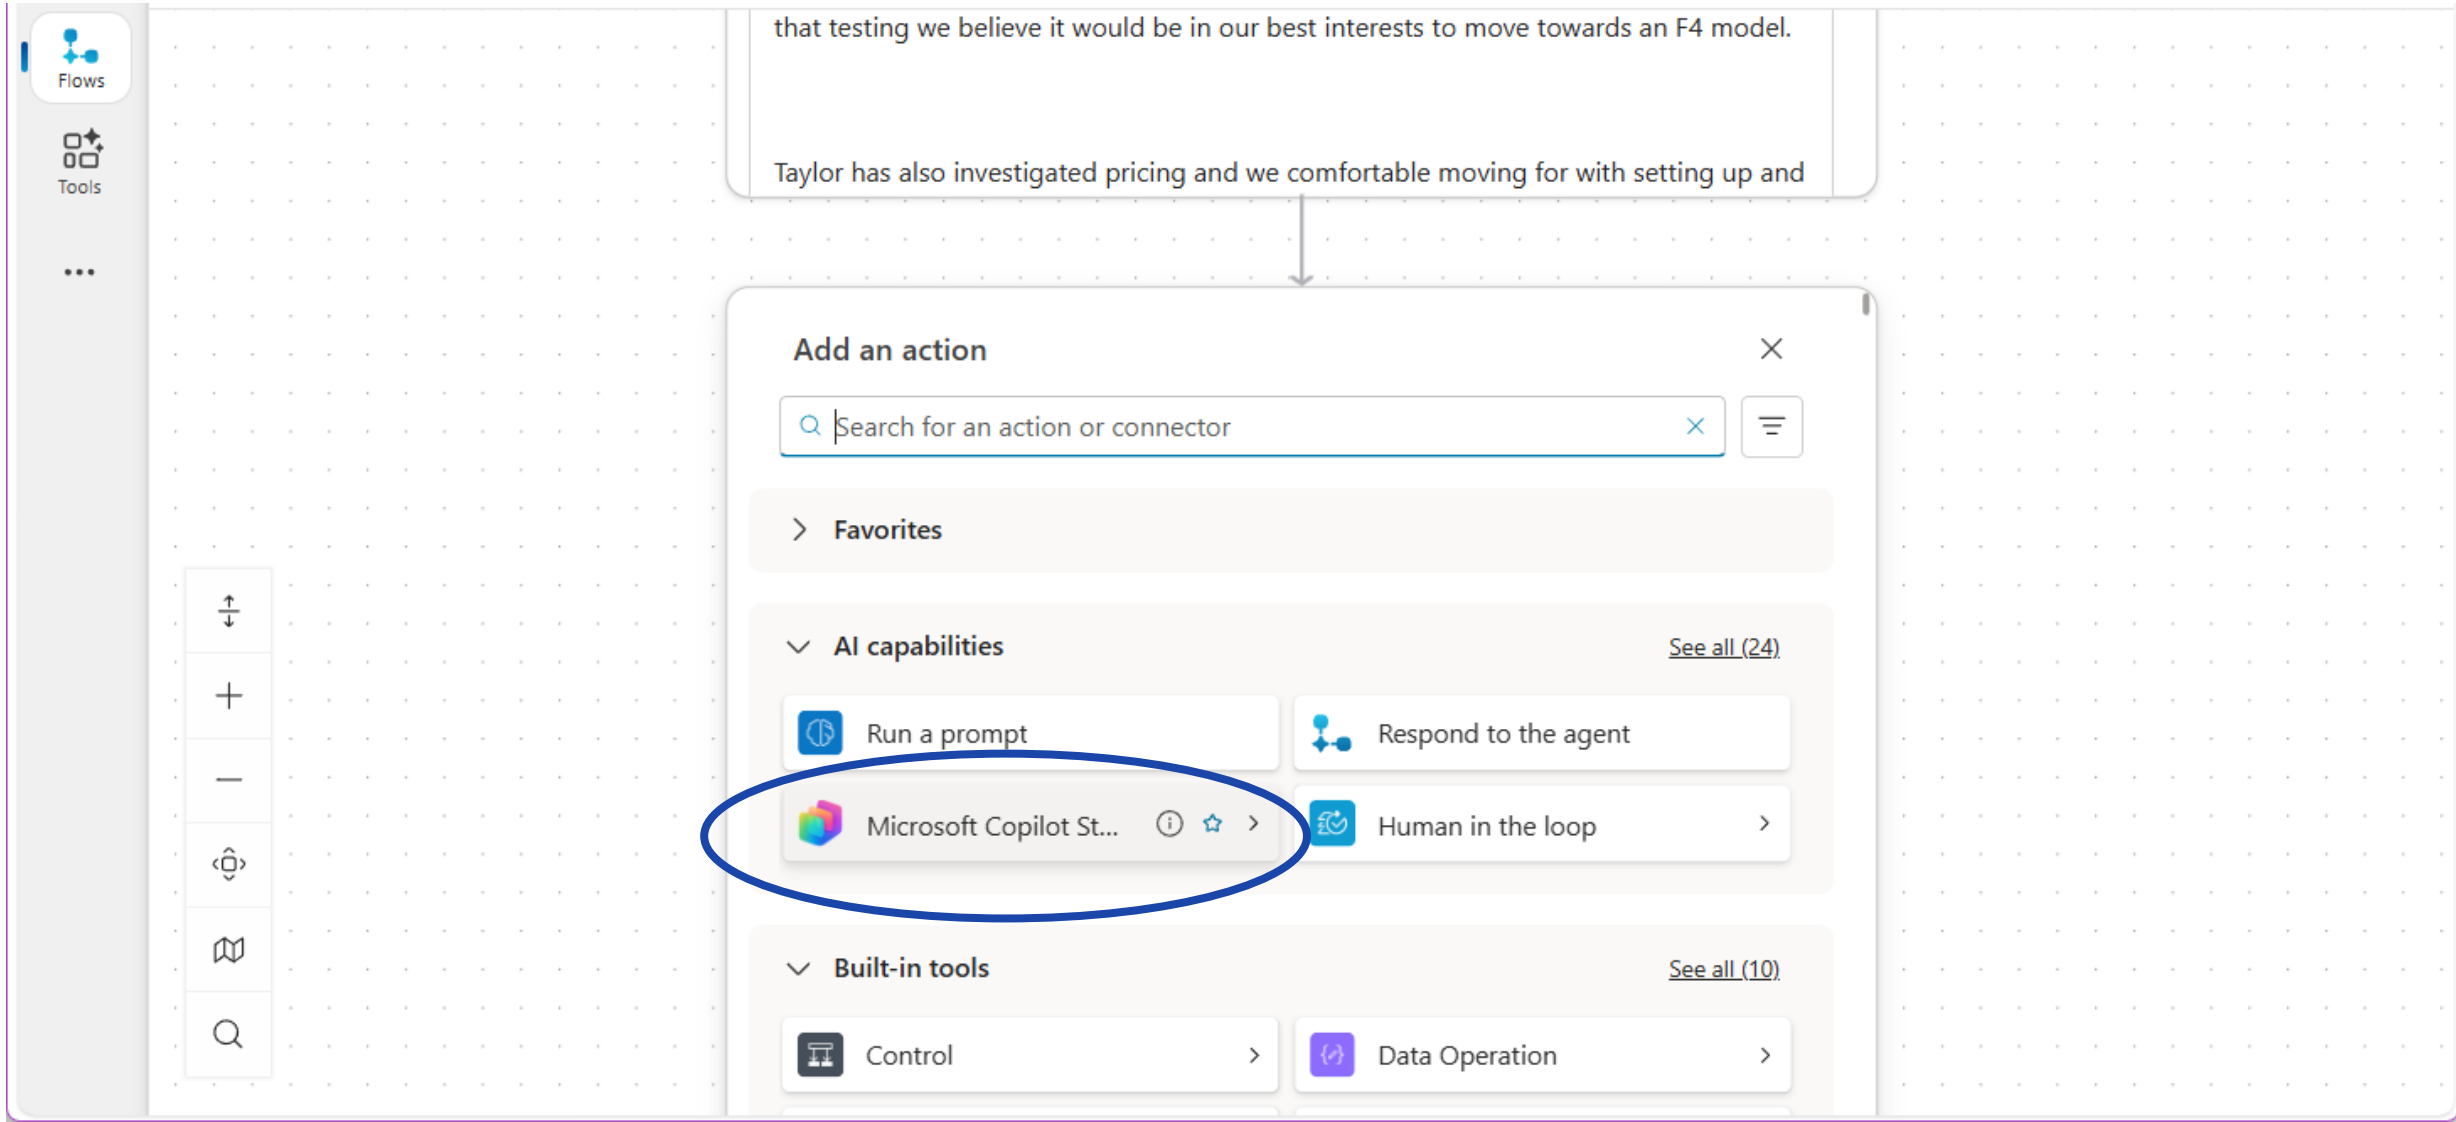

Add an action, and search for “initialize variable”
Set Type= Sting and paste in body of email sample from your thumb drive for this lab

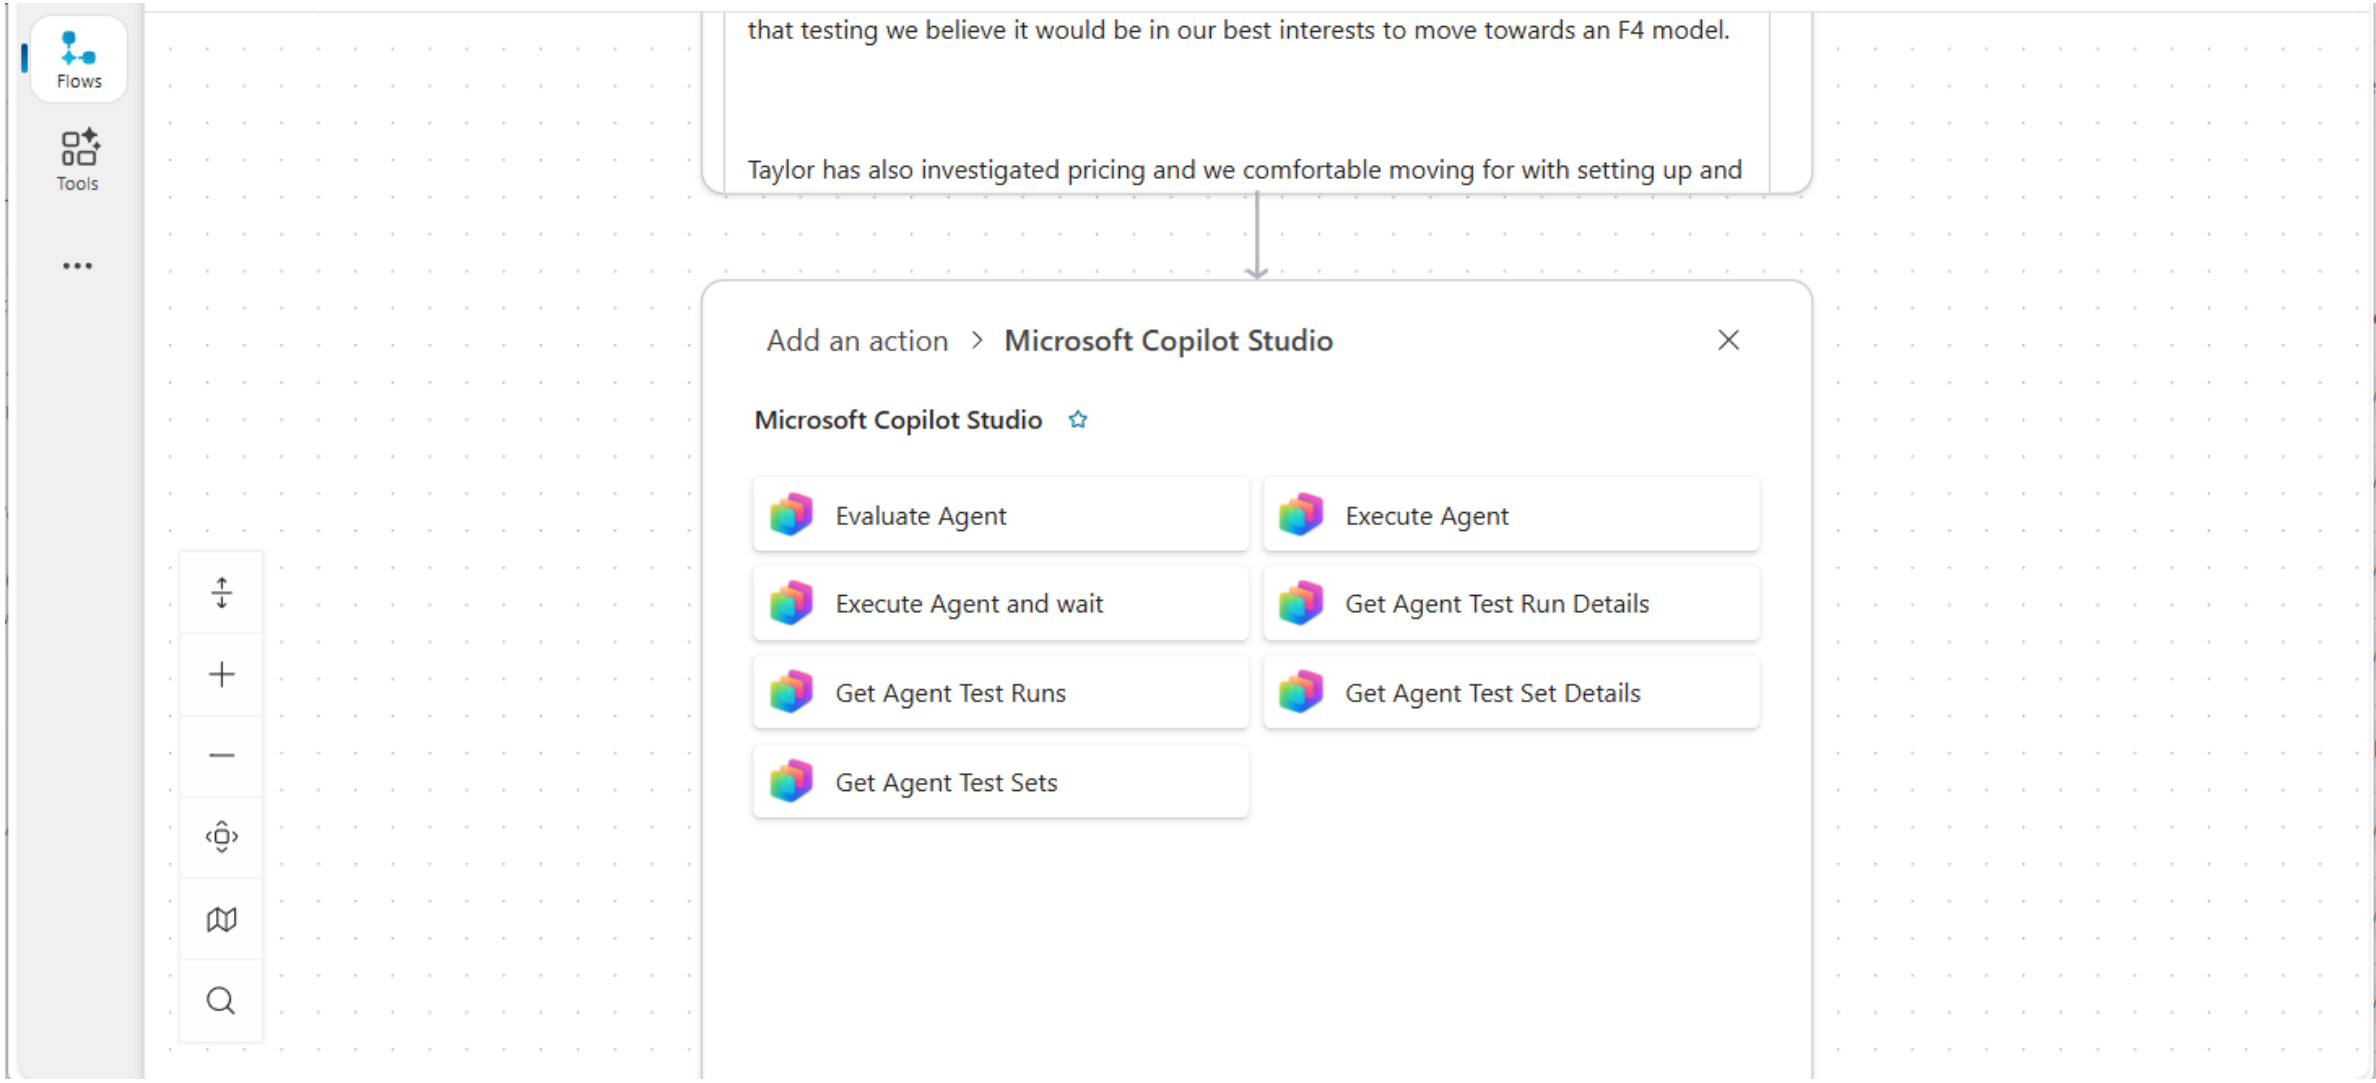

[Save Draft] then Scroll to the bottom of the Variables display box and click the button to add another step

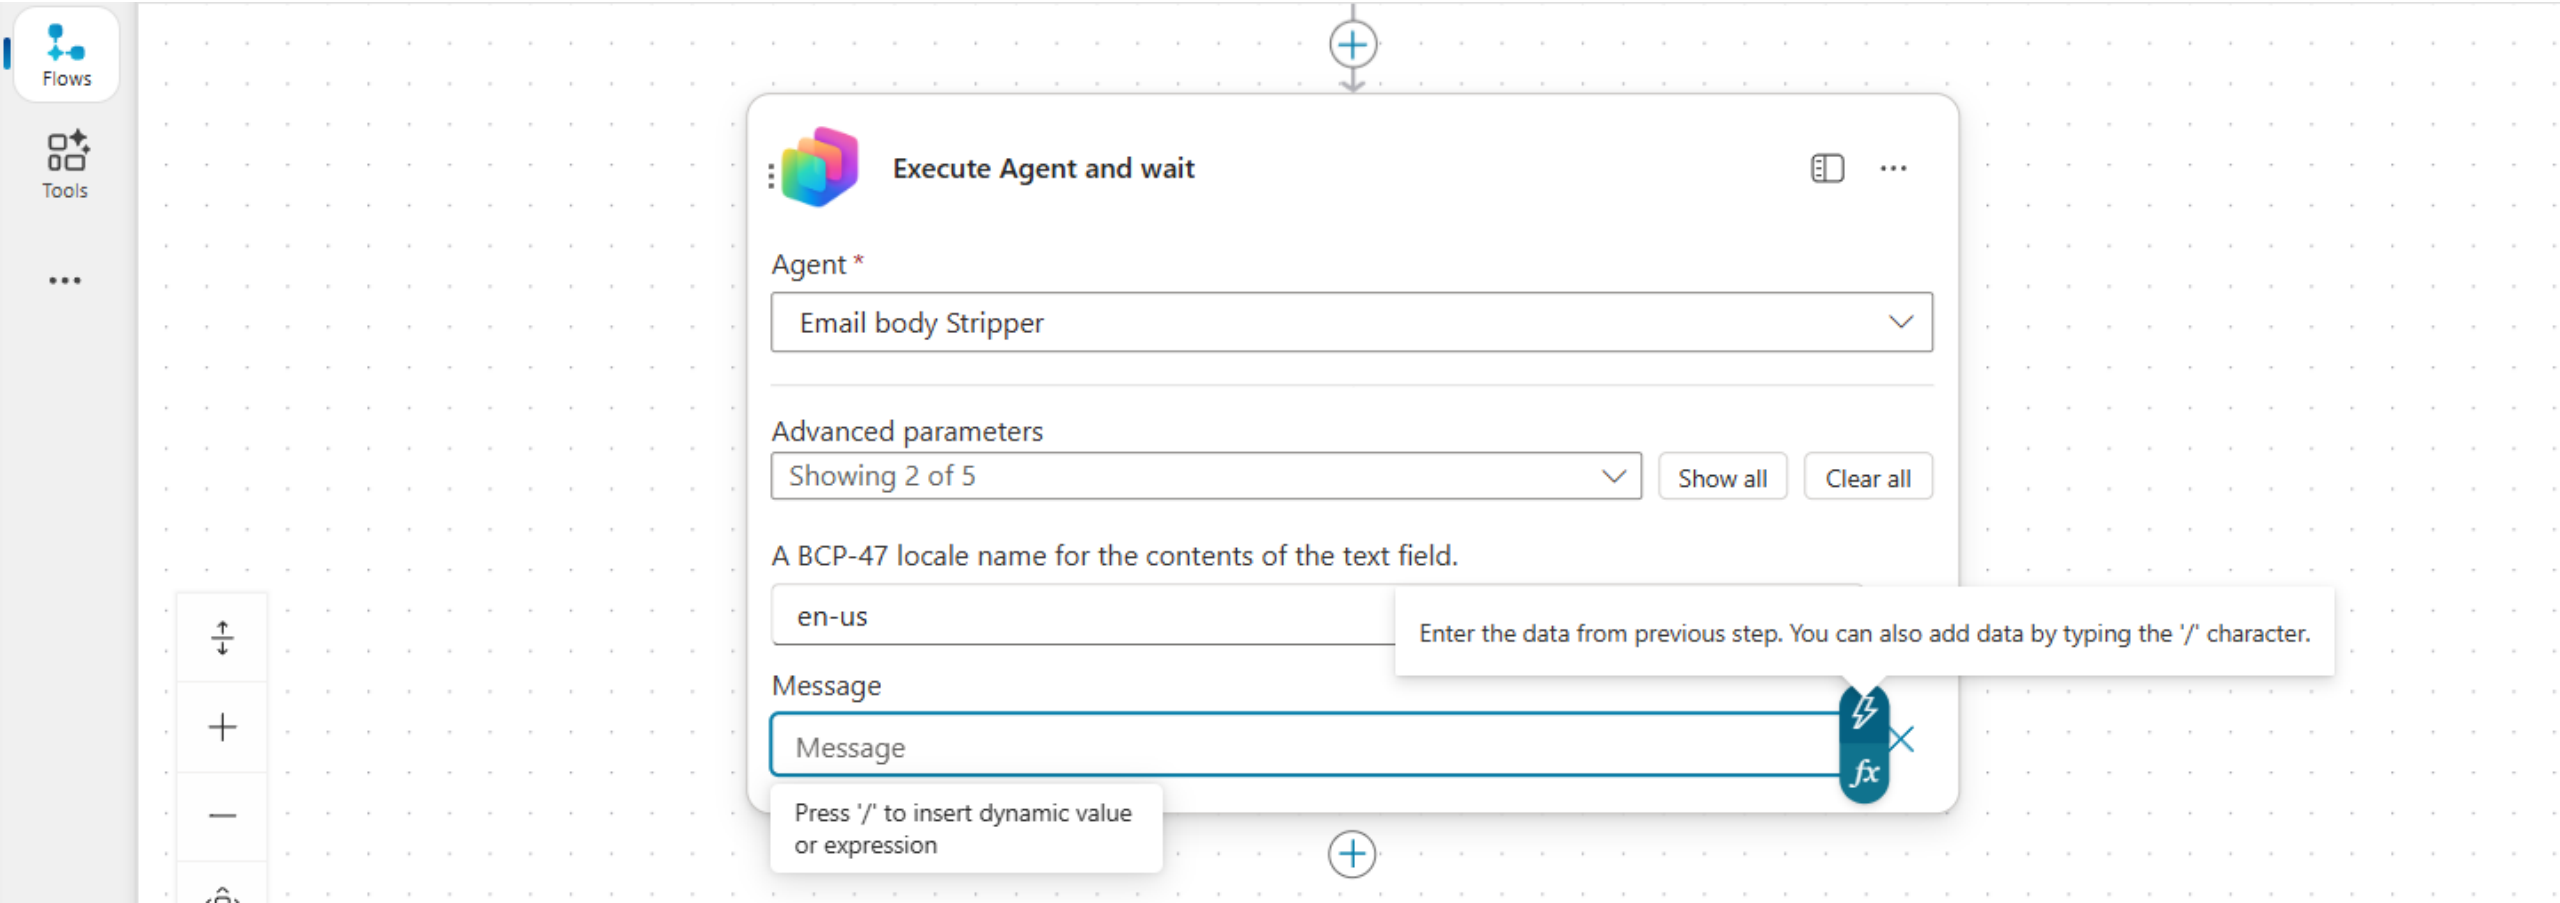

Add another step to Copilot – yes, we're calling the stripper!

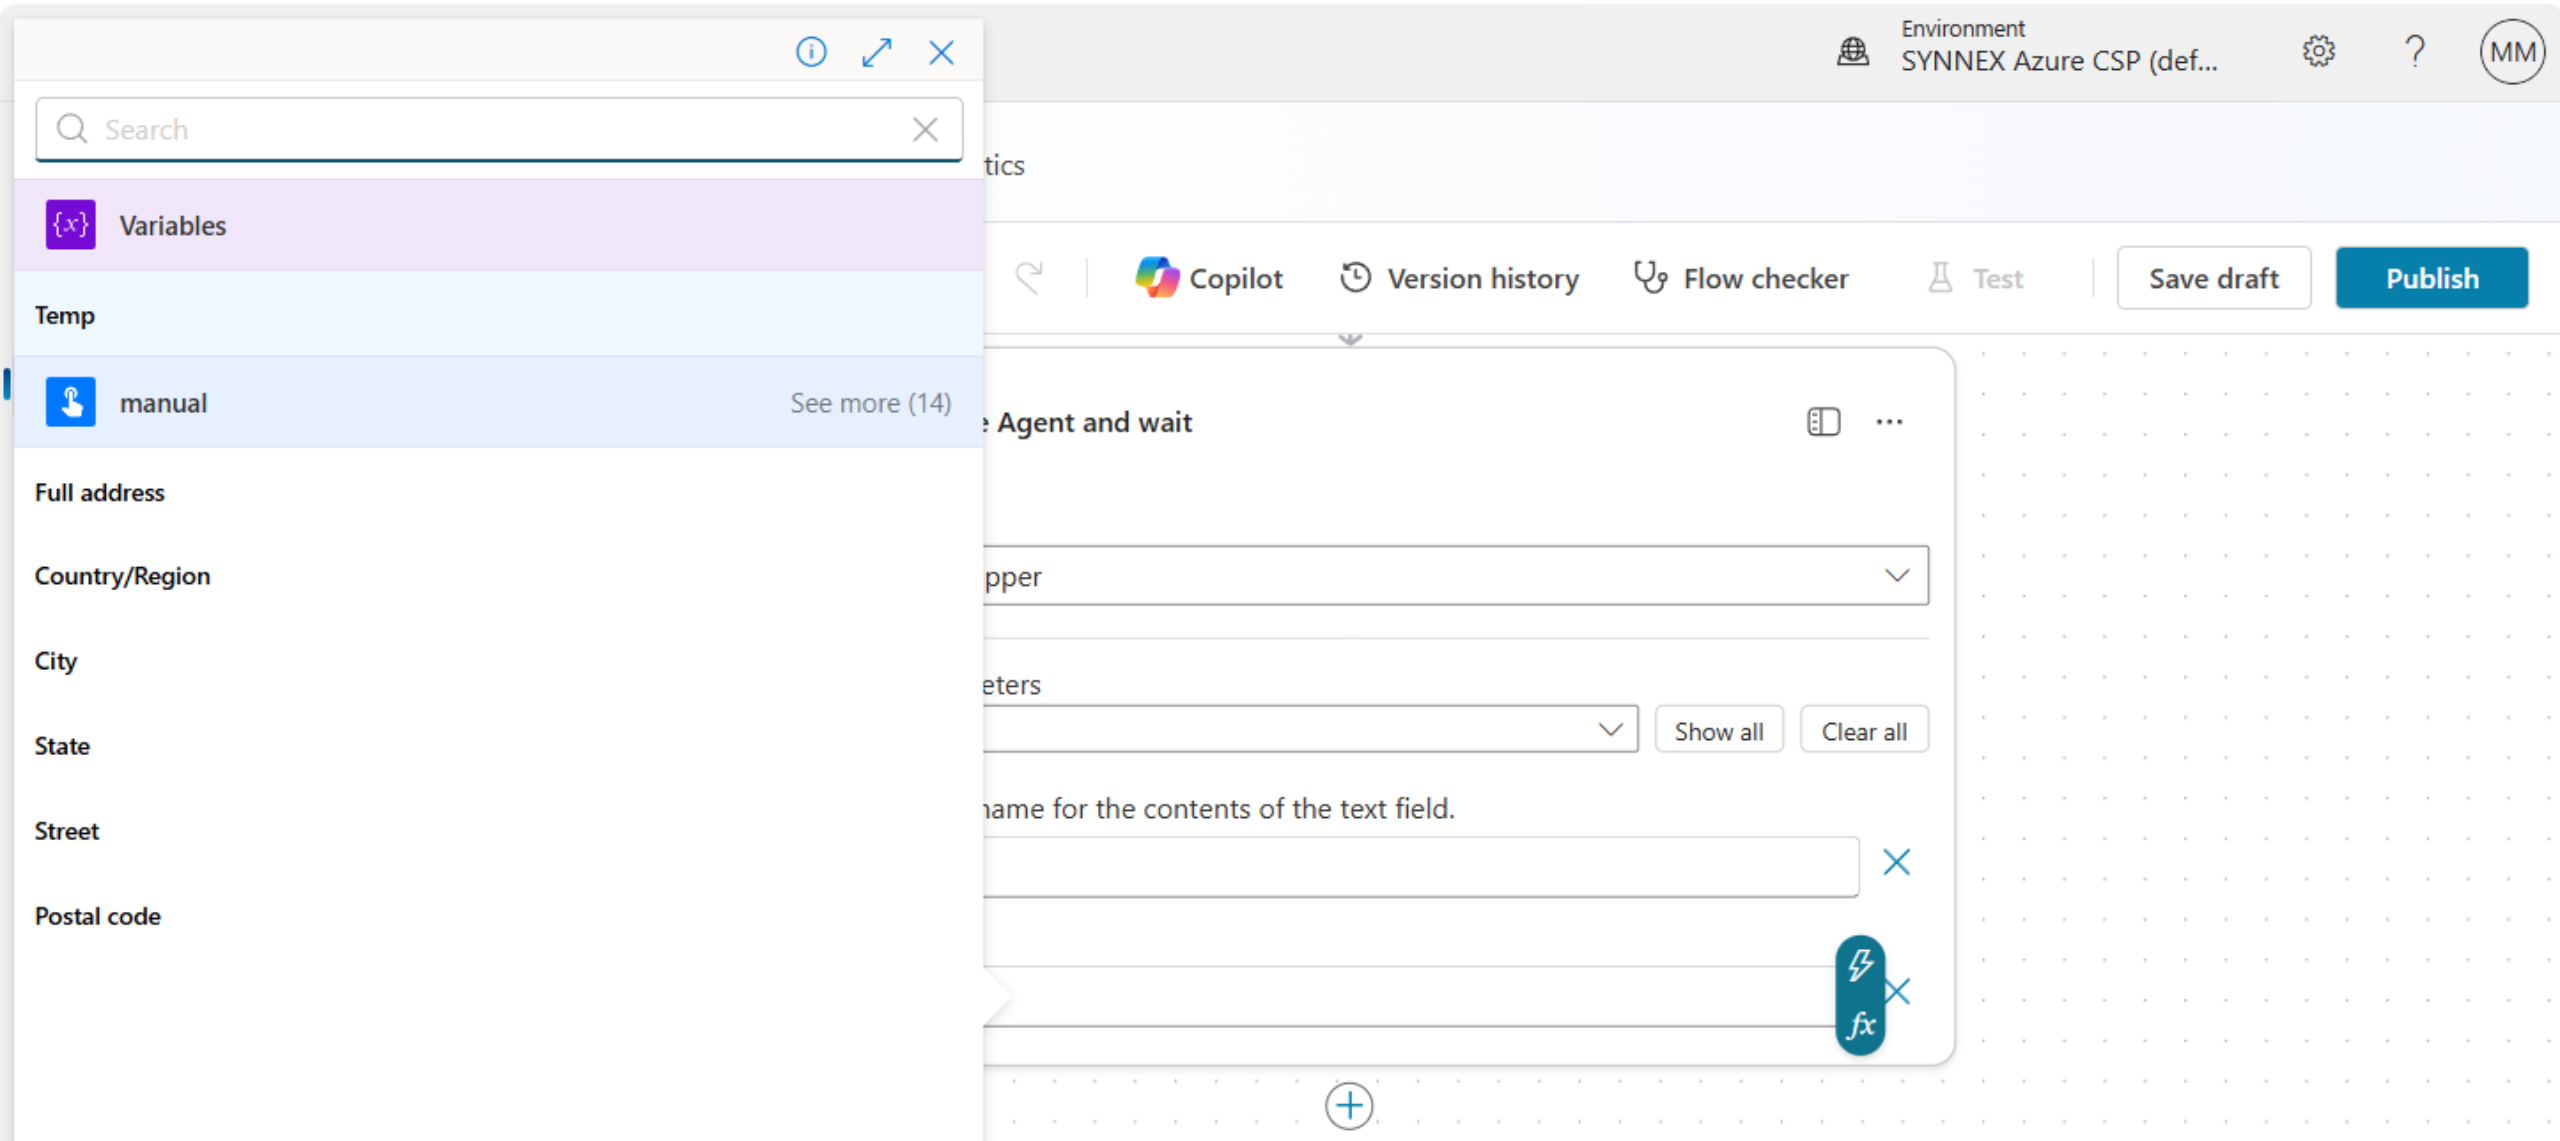

Select Execute Agent and wait – Can you guess why we wait?

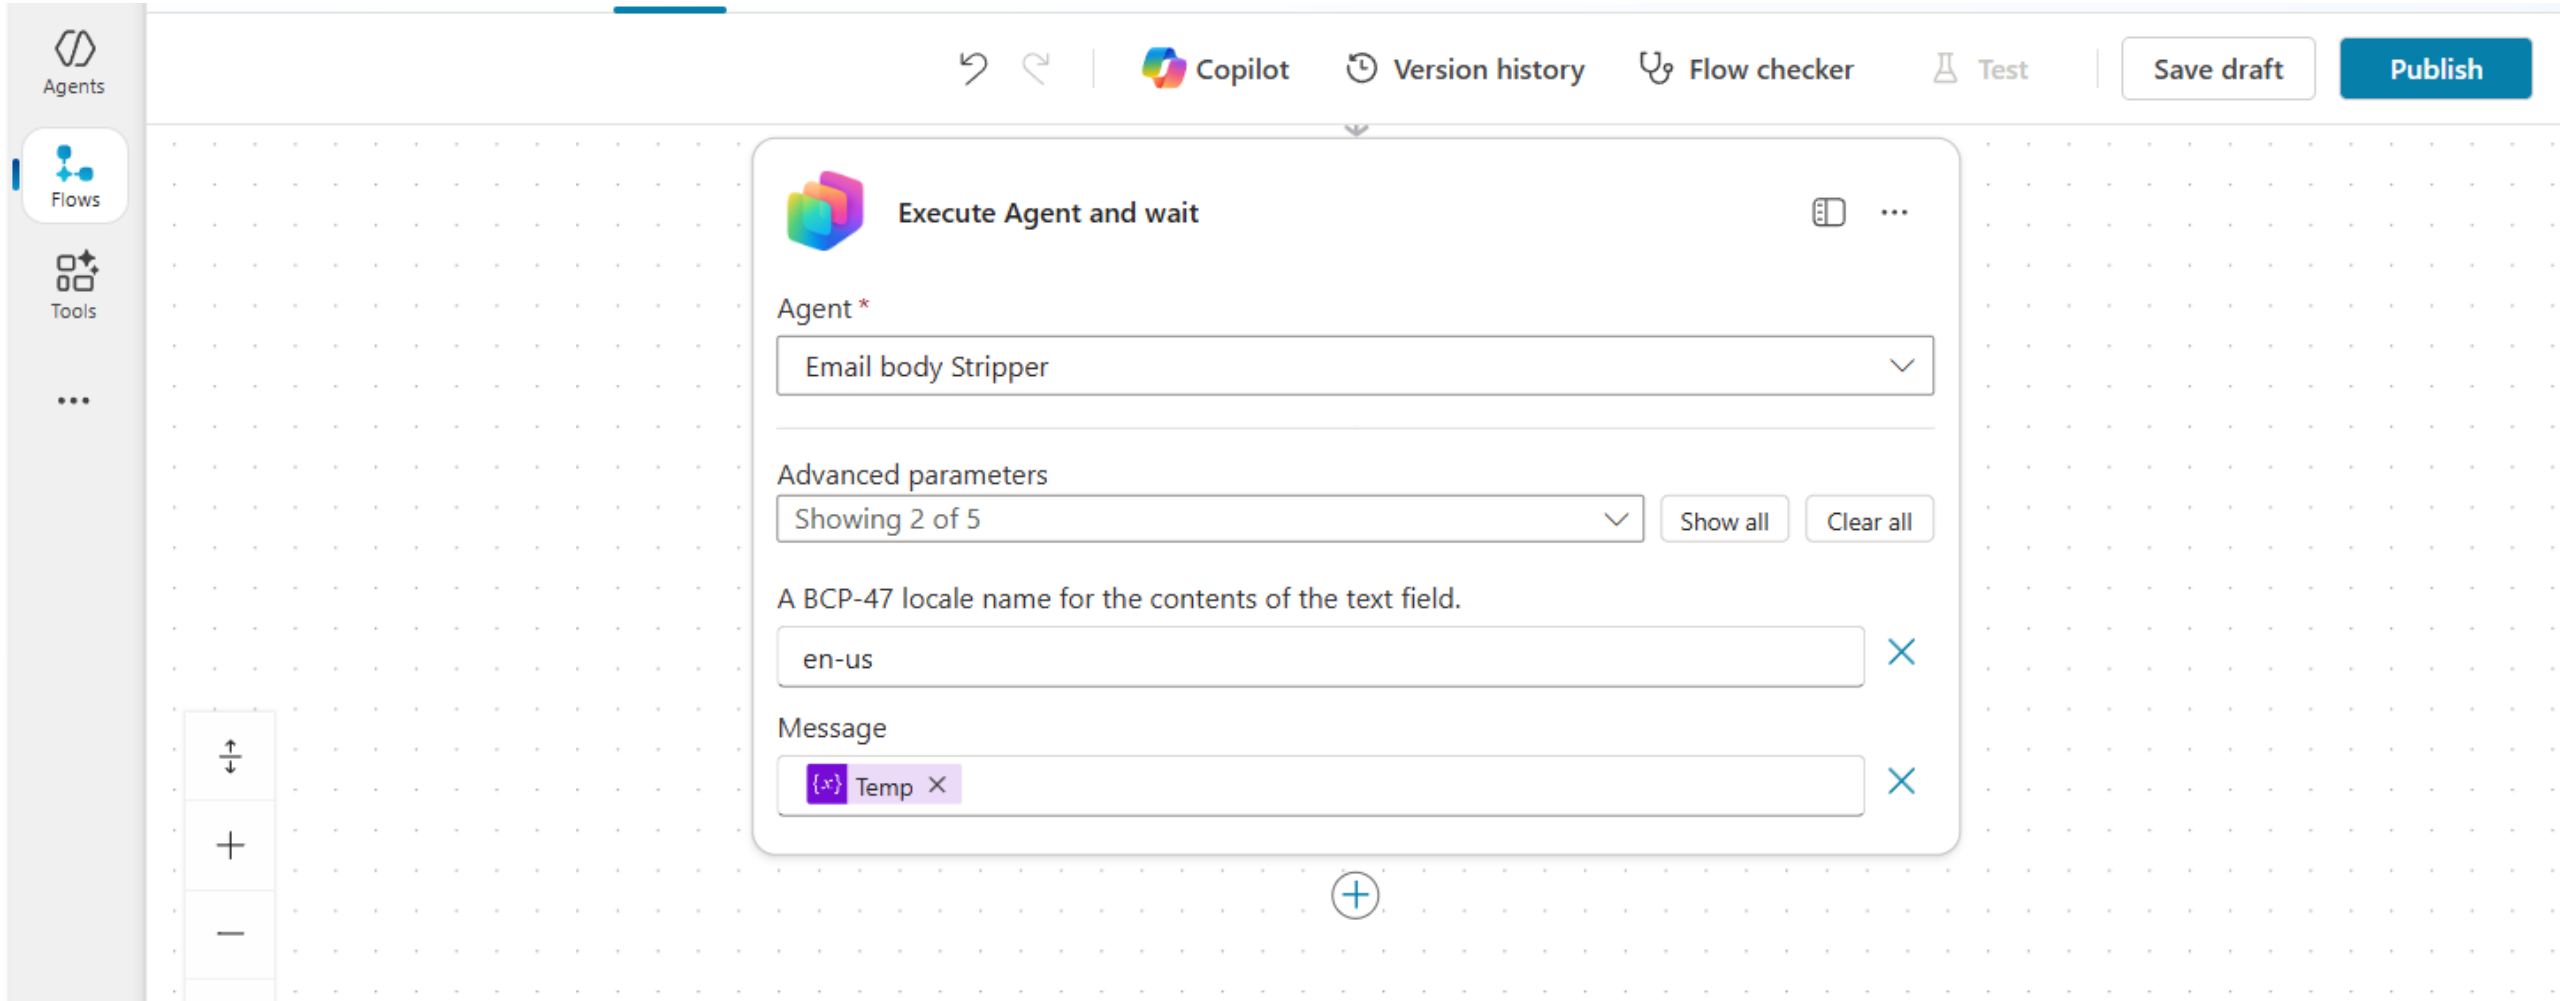

Drop down the parameters, enter BCP-47 value as en-us
Click on Message box and select the lighting bolt to pull reference from the data currently in the variable set earlier

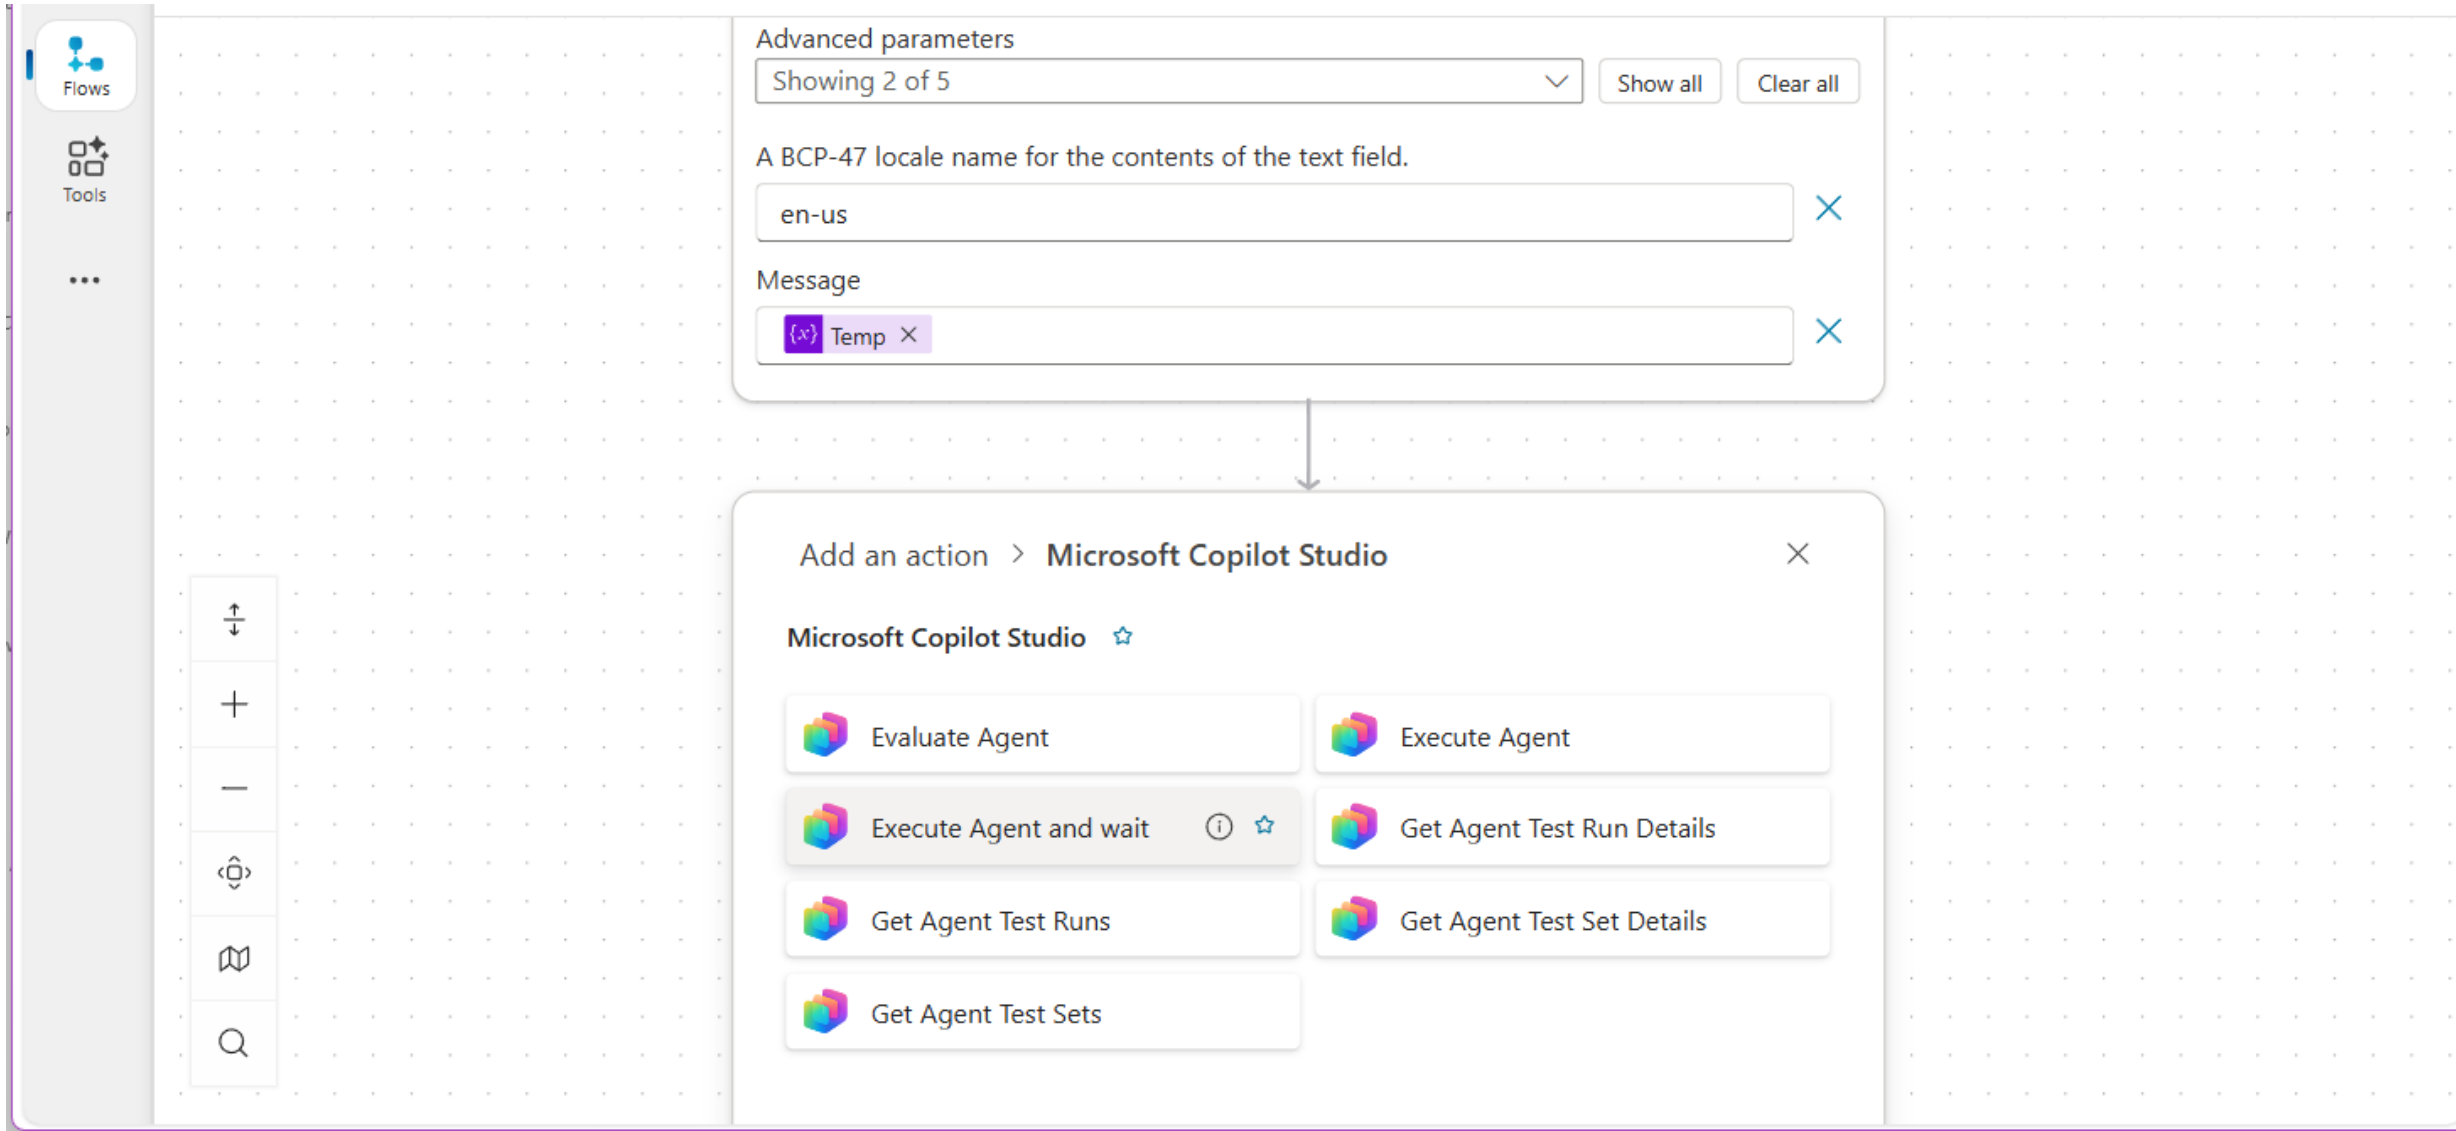

Multi-Agents with Agent flow

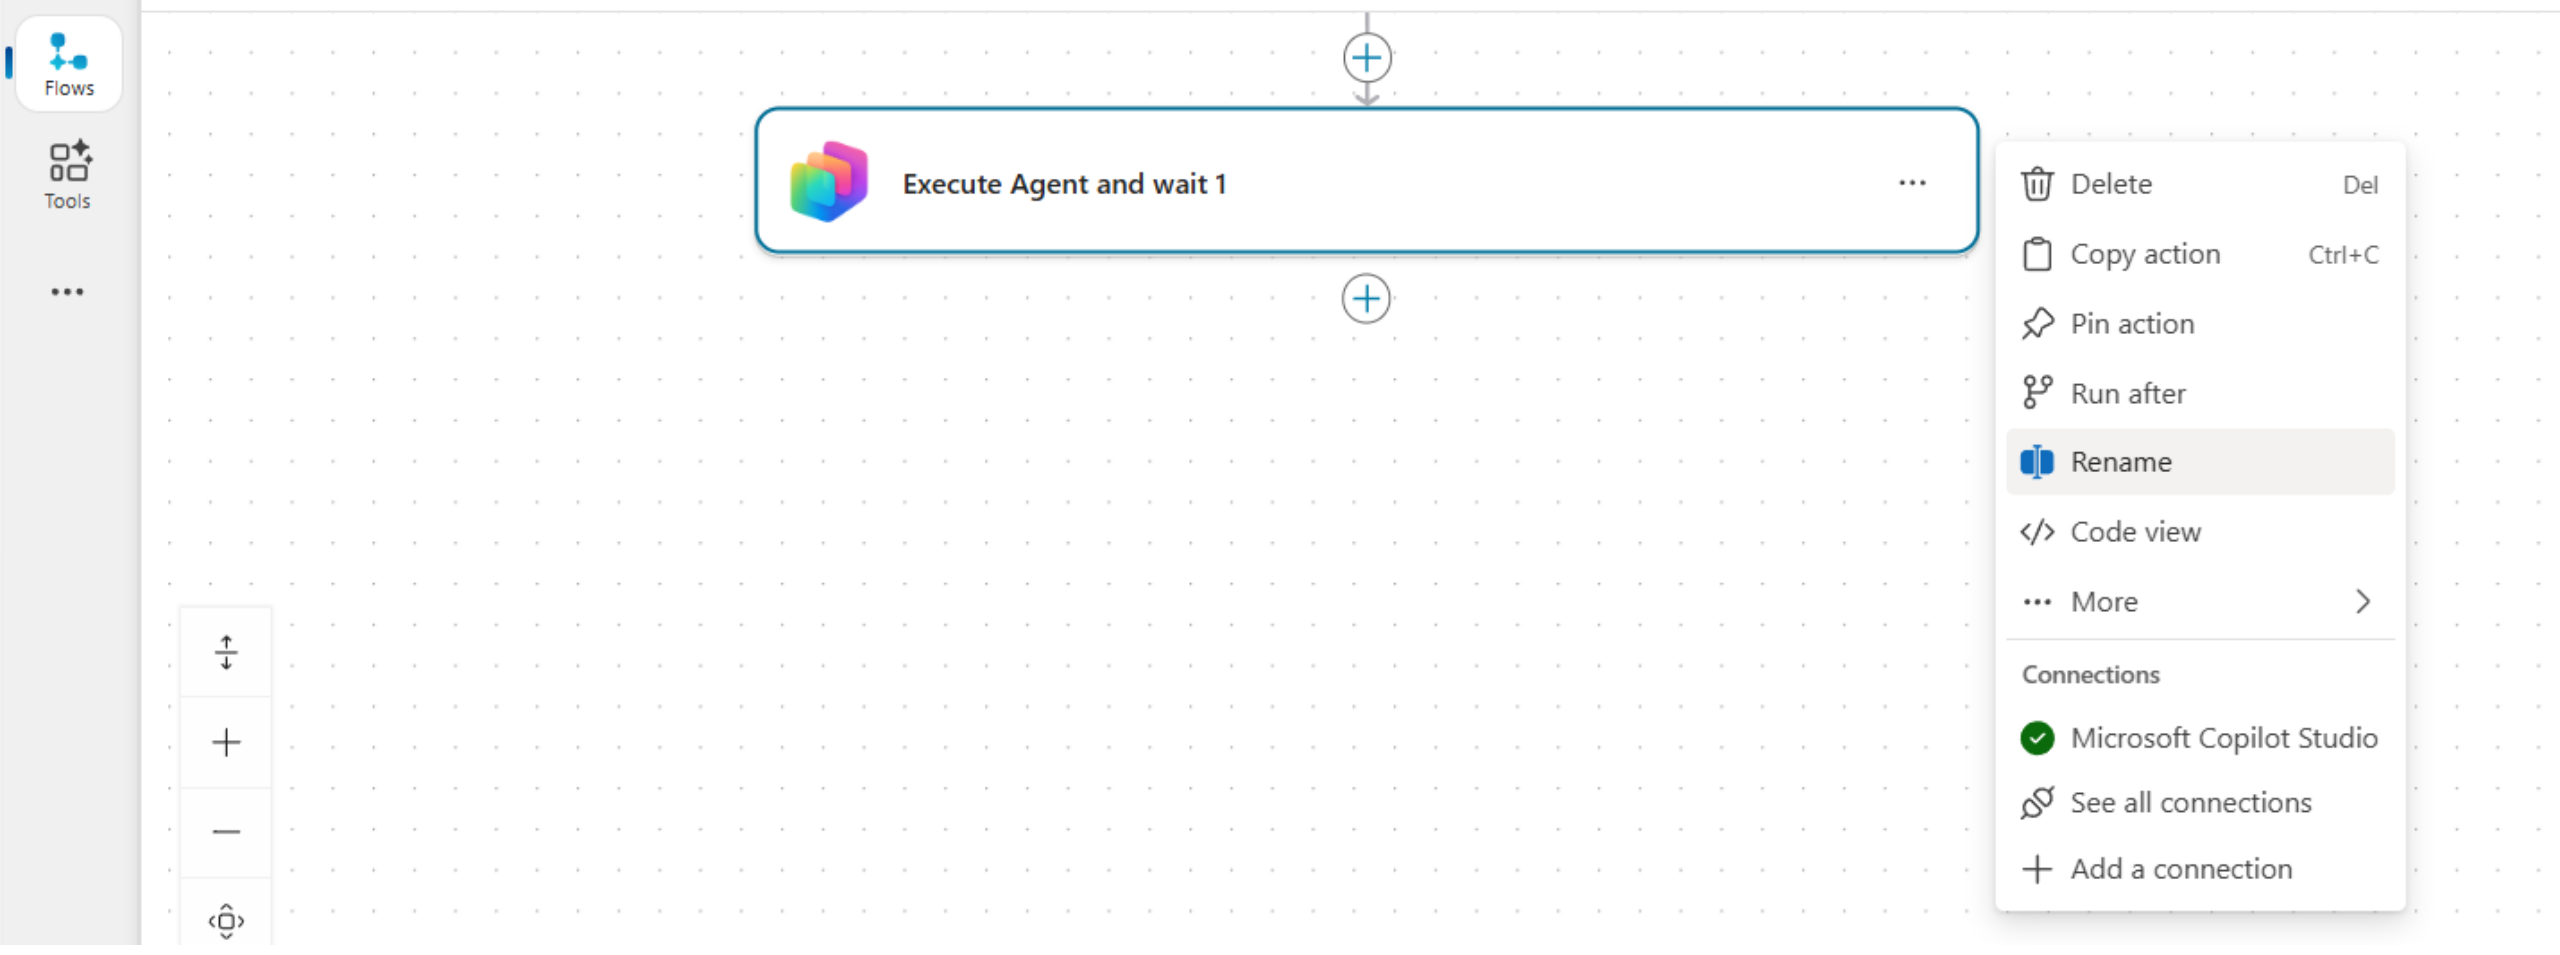

Now Publish

Showing 2 of 5
Show all
Clear all
A BCP-47 locale name for the contents of the text field.
en-us
Message
Temp

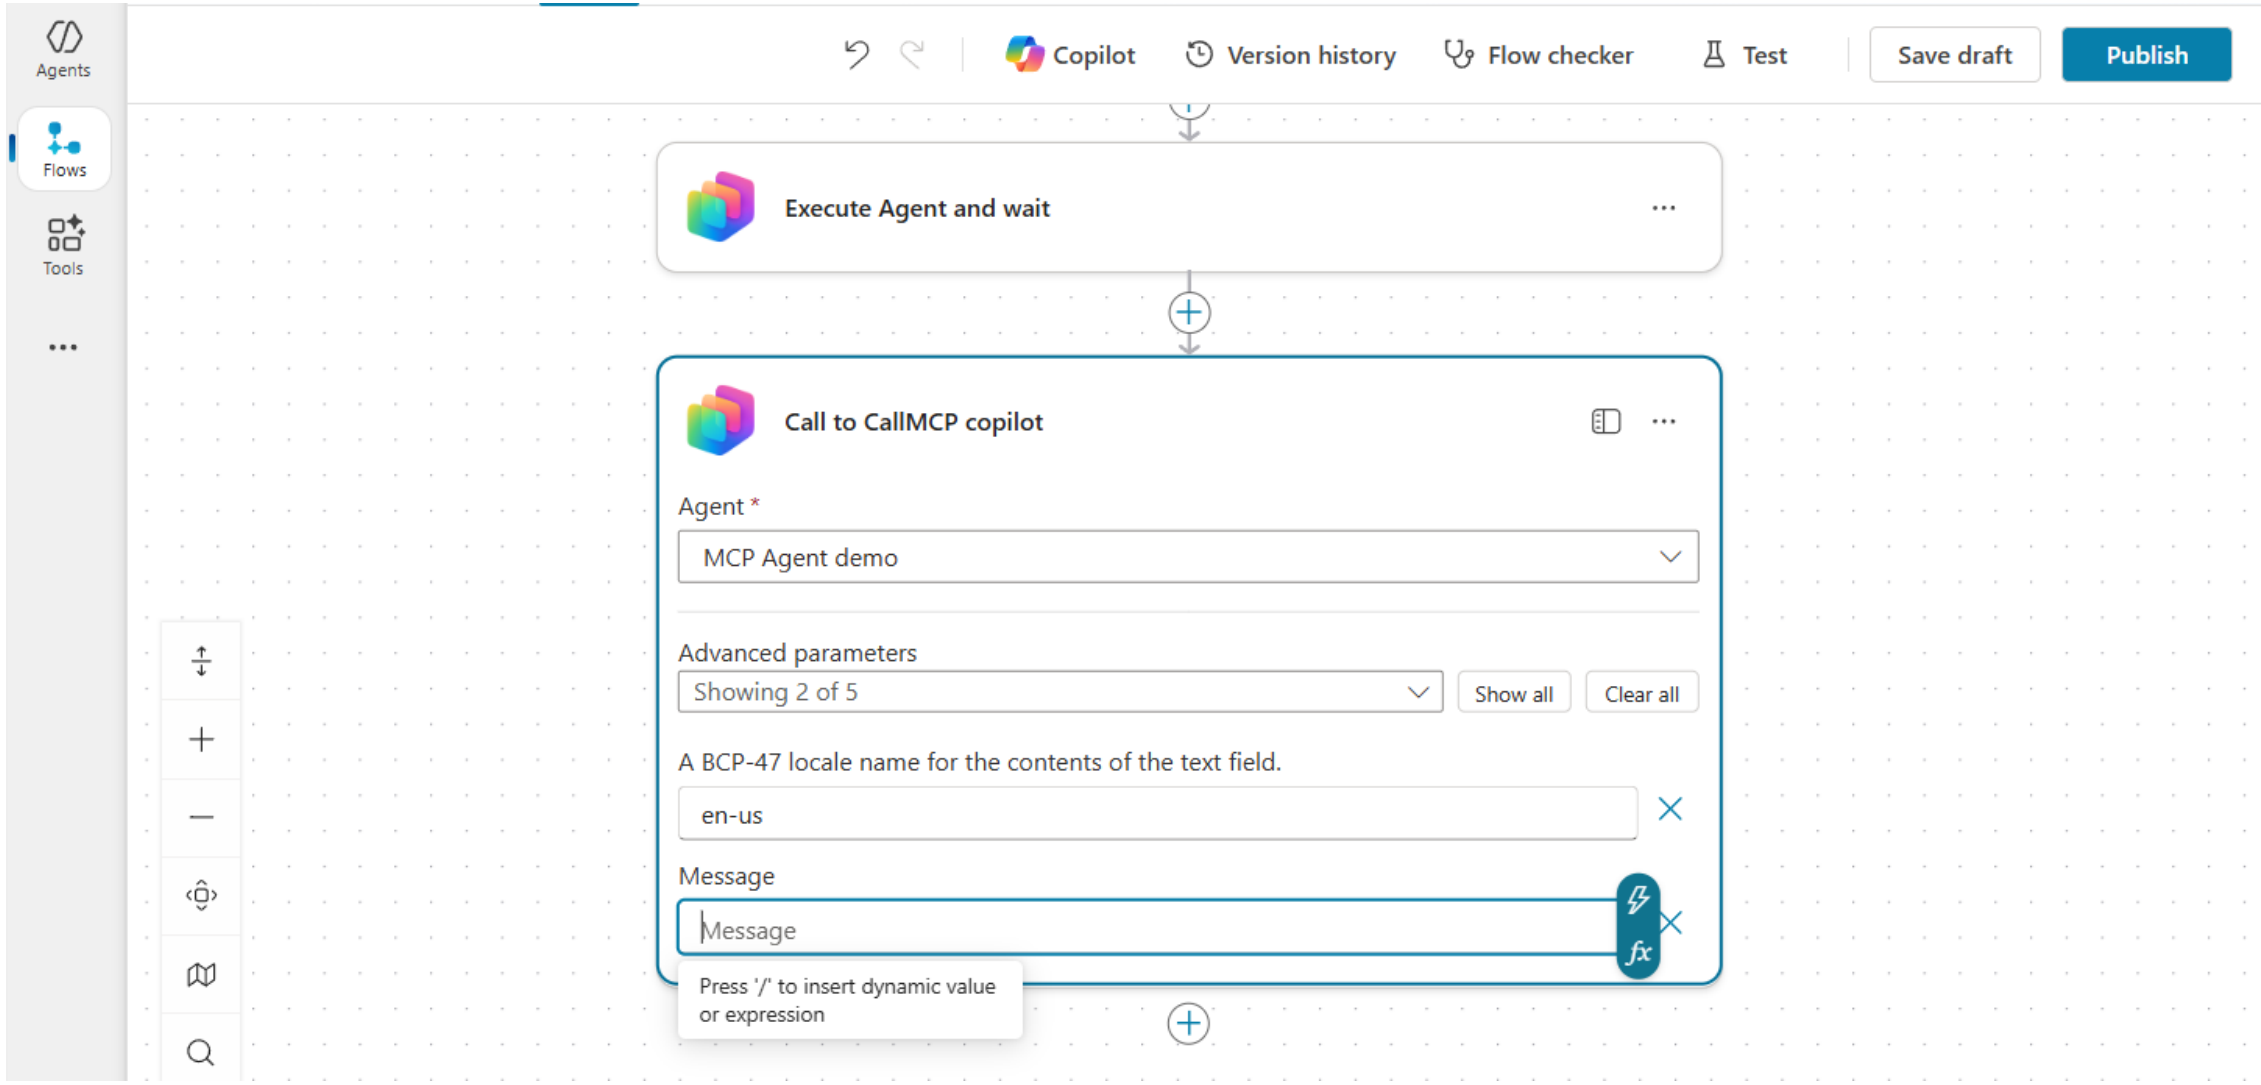

Add another Action to call the MCP server agent

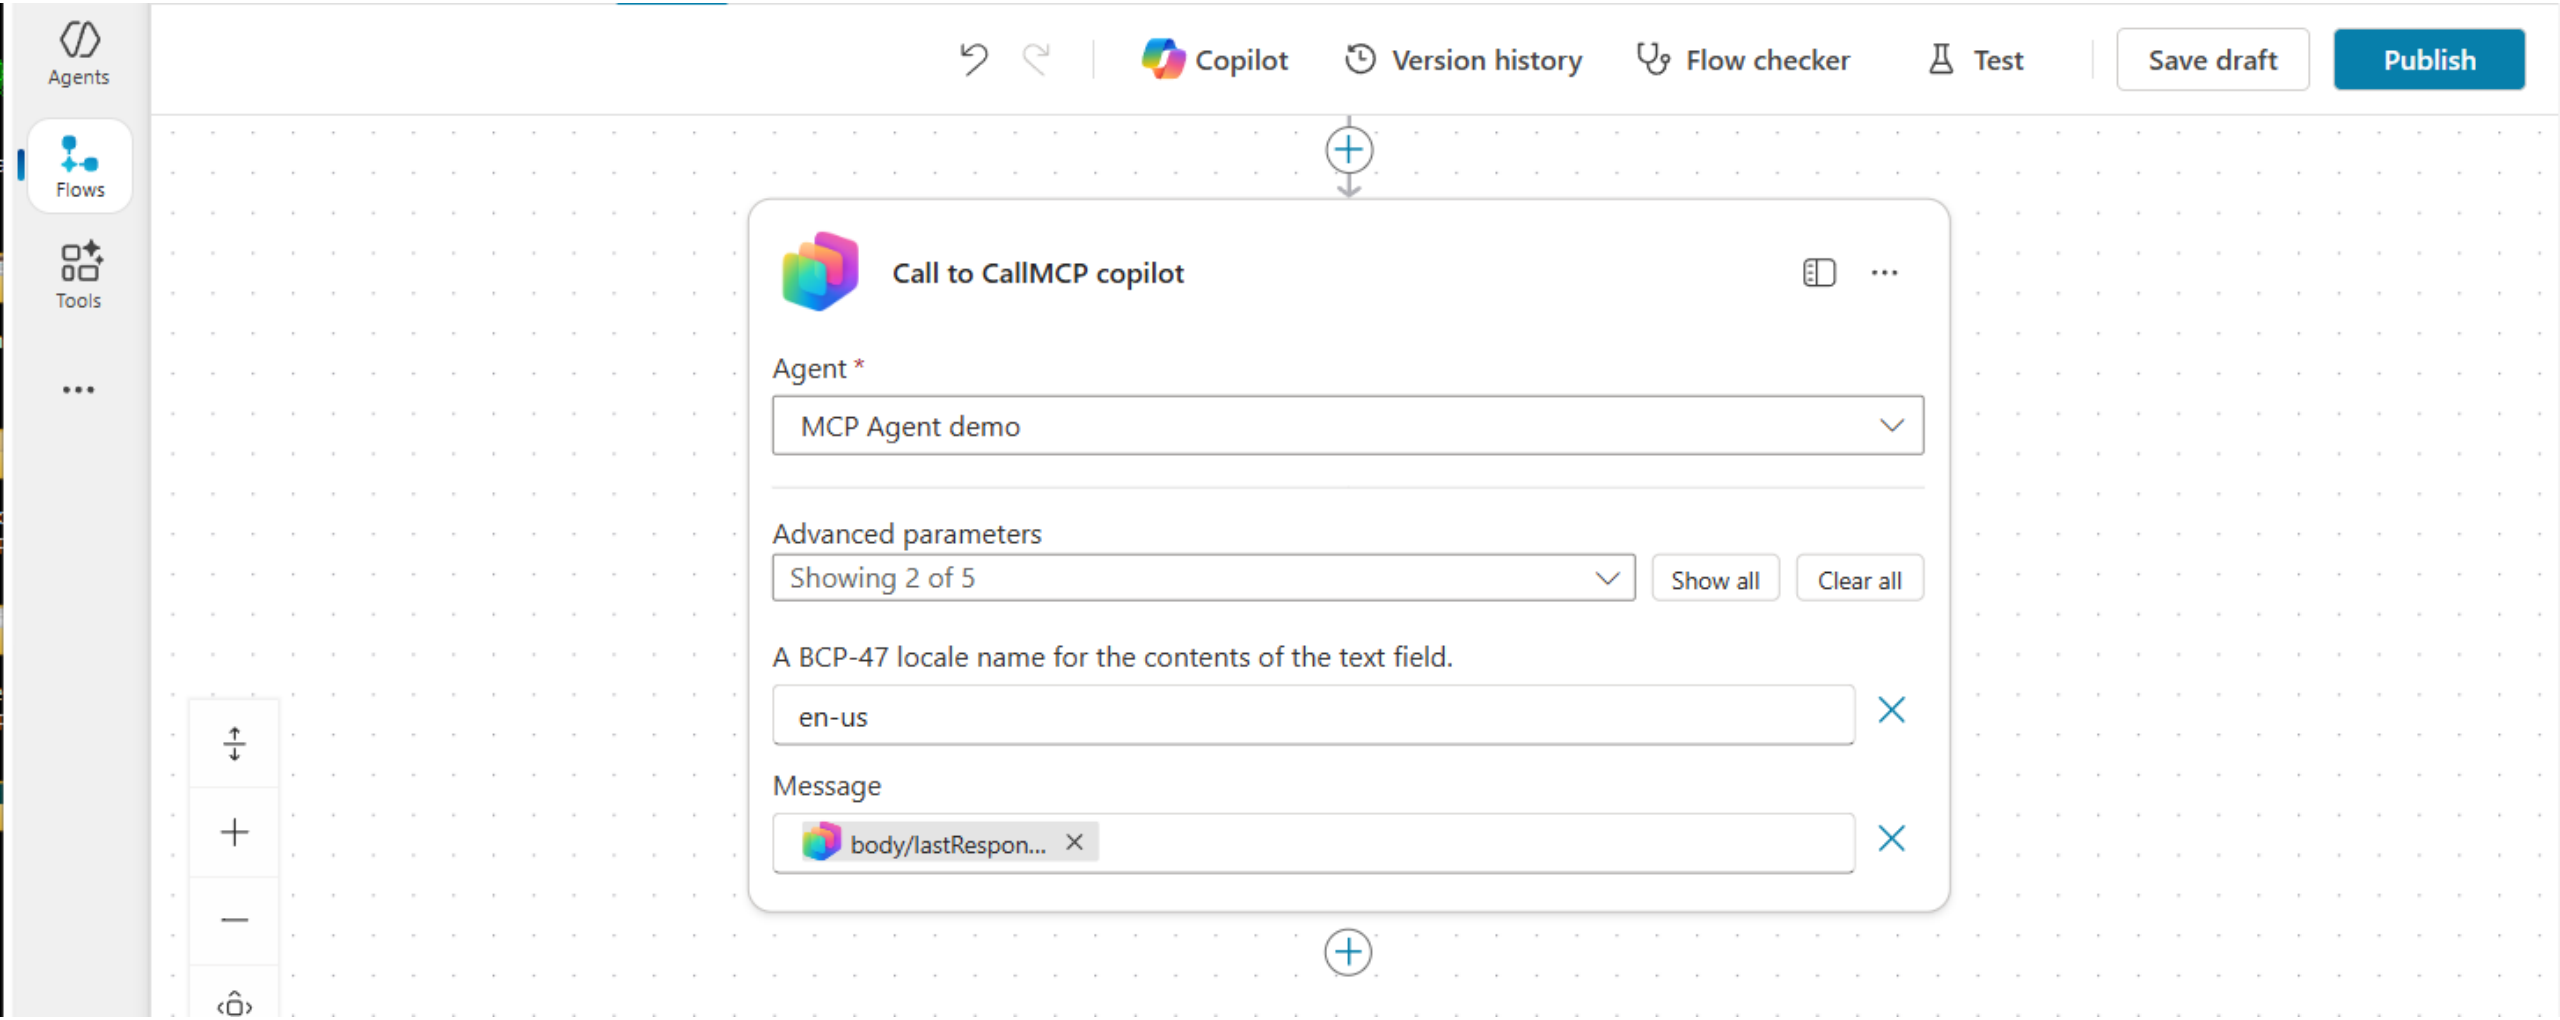

Let’s rename this action to Call MCP Copilot

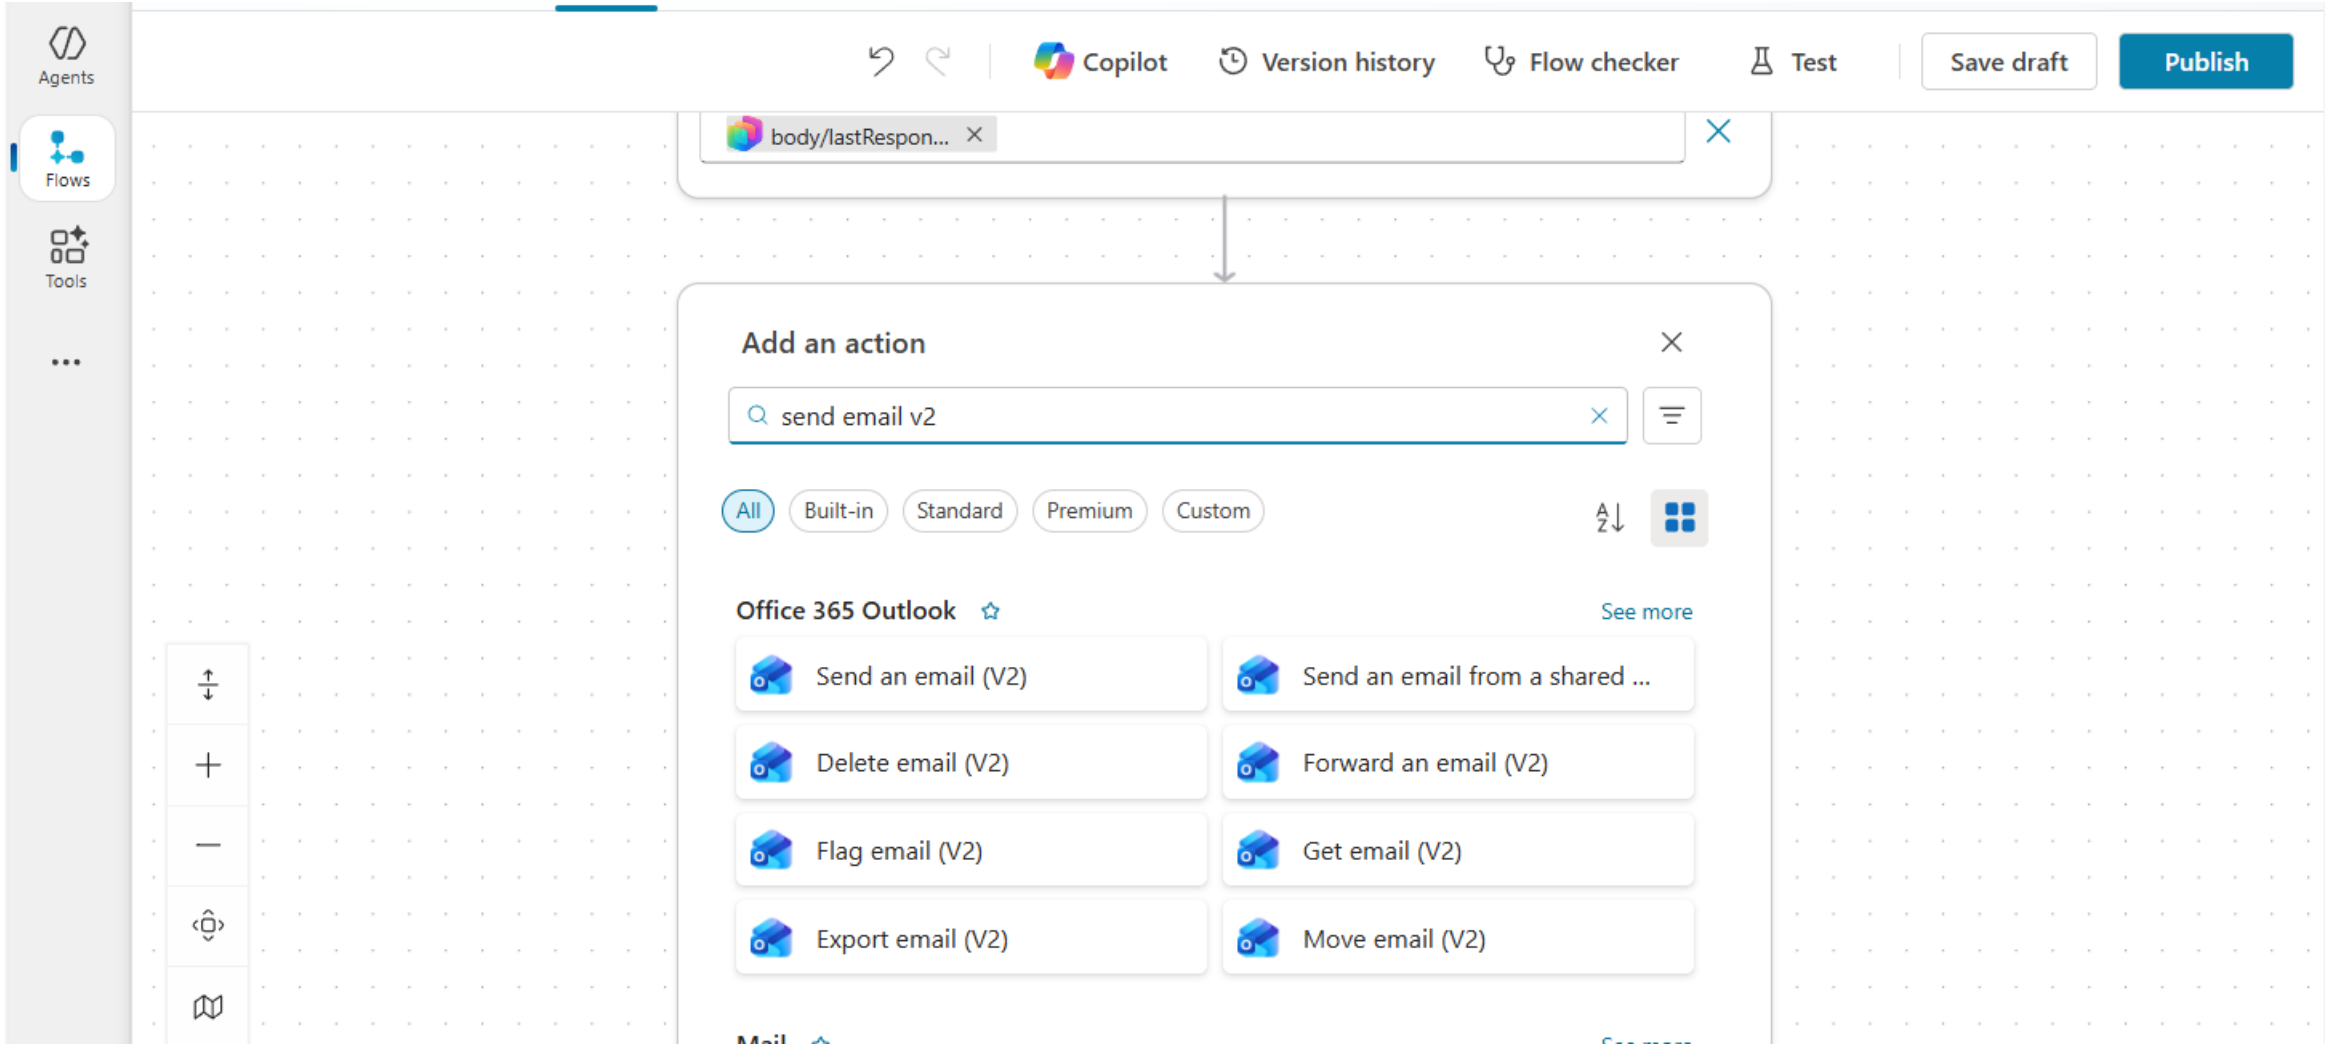

For this agent set Language to en-us, click bolt to set input to return from previous agent call

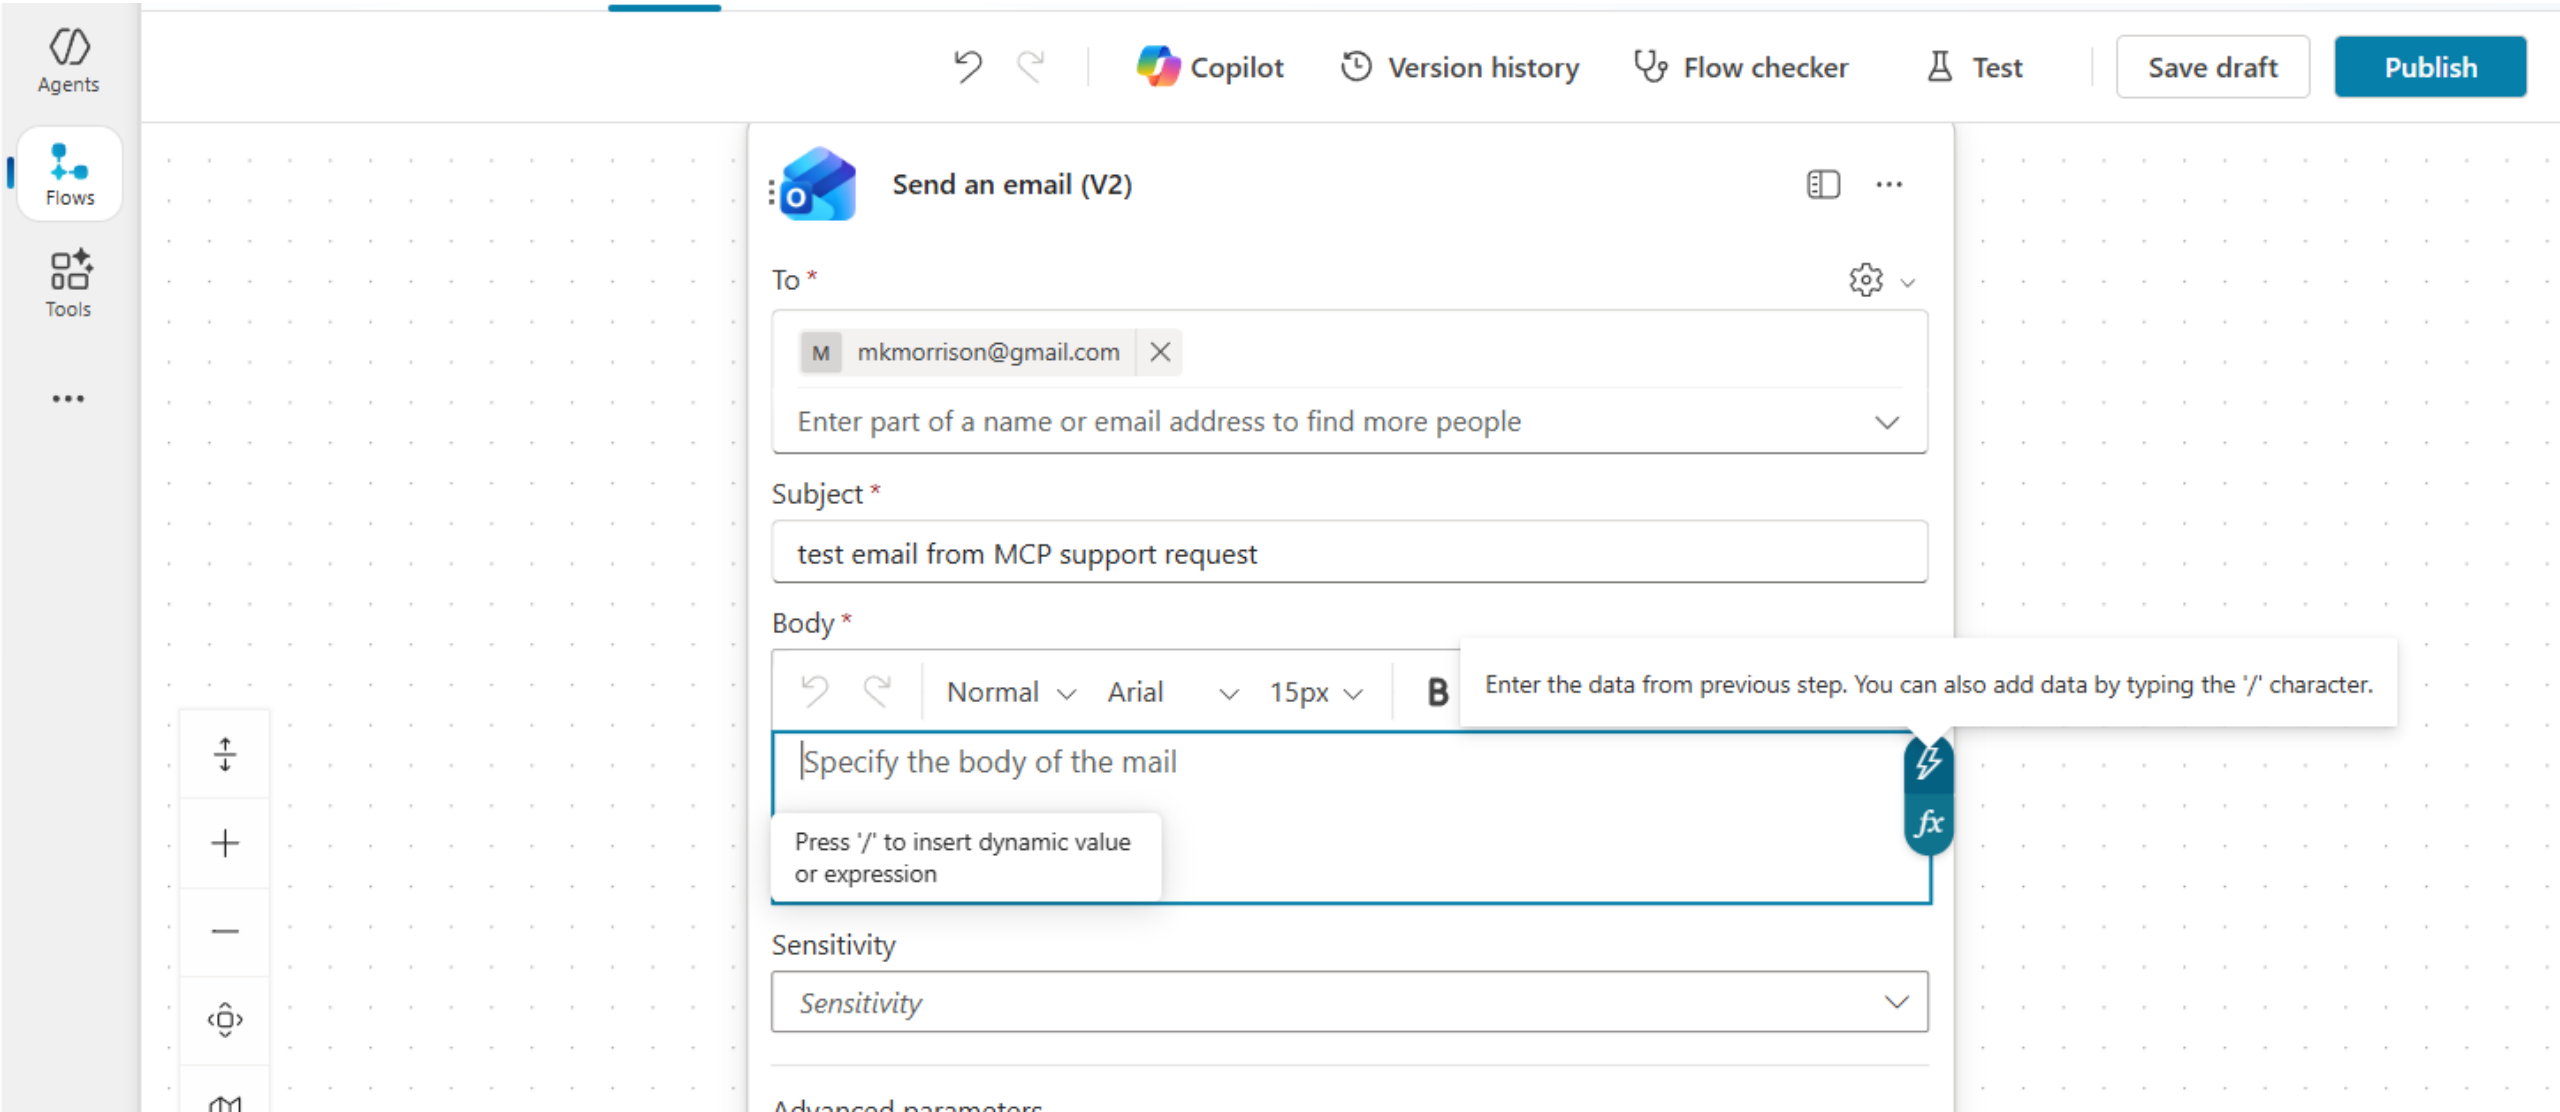

For this agent set Language to en-us, click bolt to set input to return from previous agent call

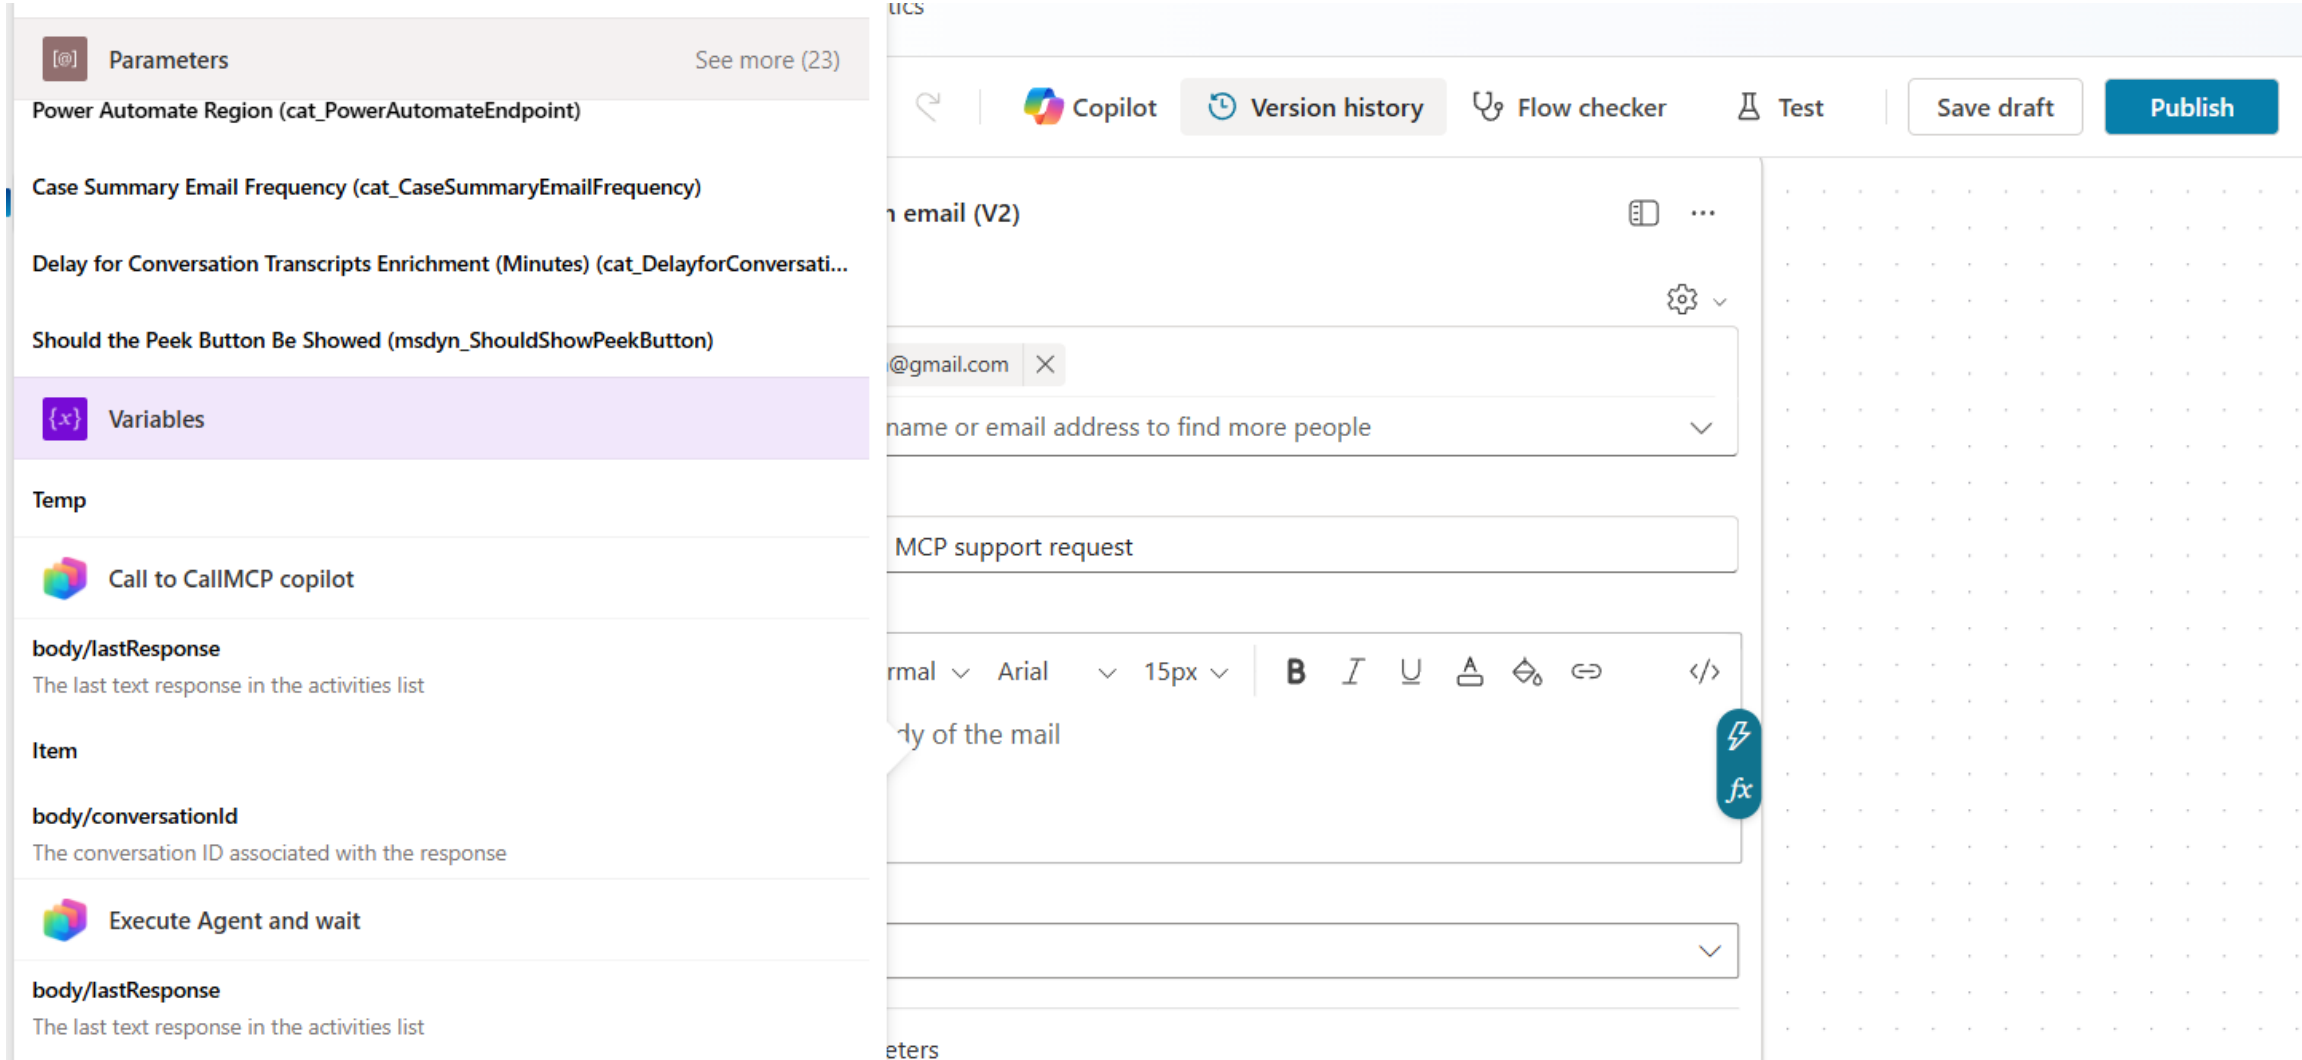

Scroll down using mouse-down for more real estate, then add another action to send an email (v2) “exchange”

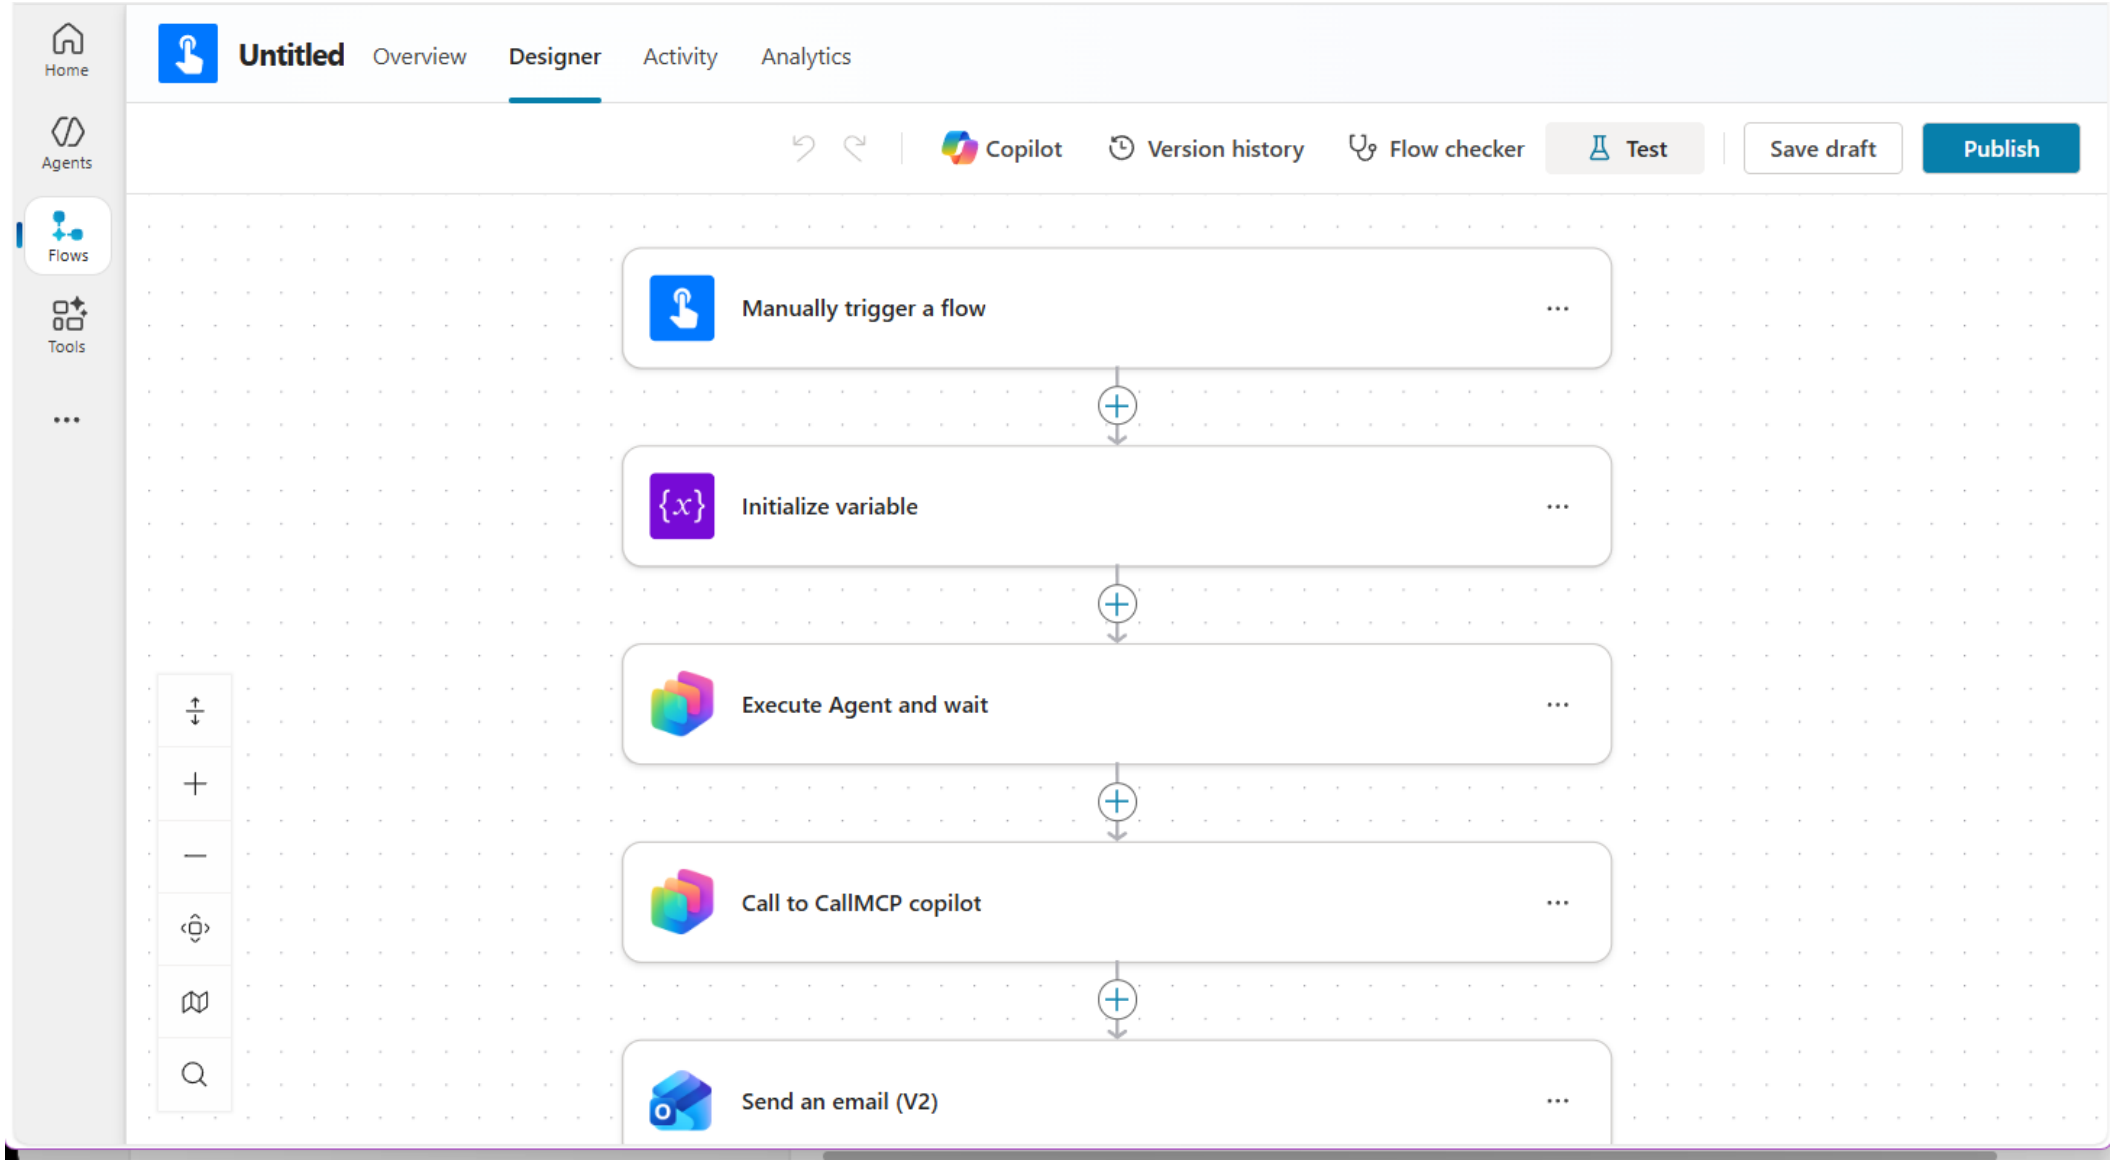

Configure values to use for sending this email

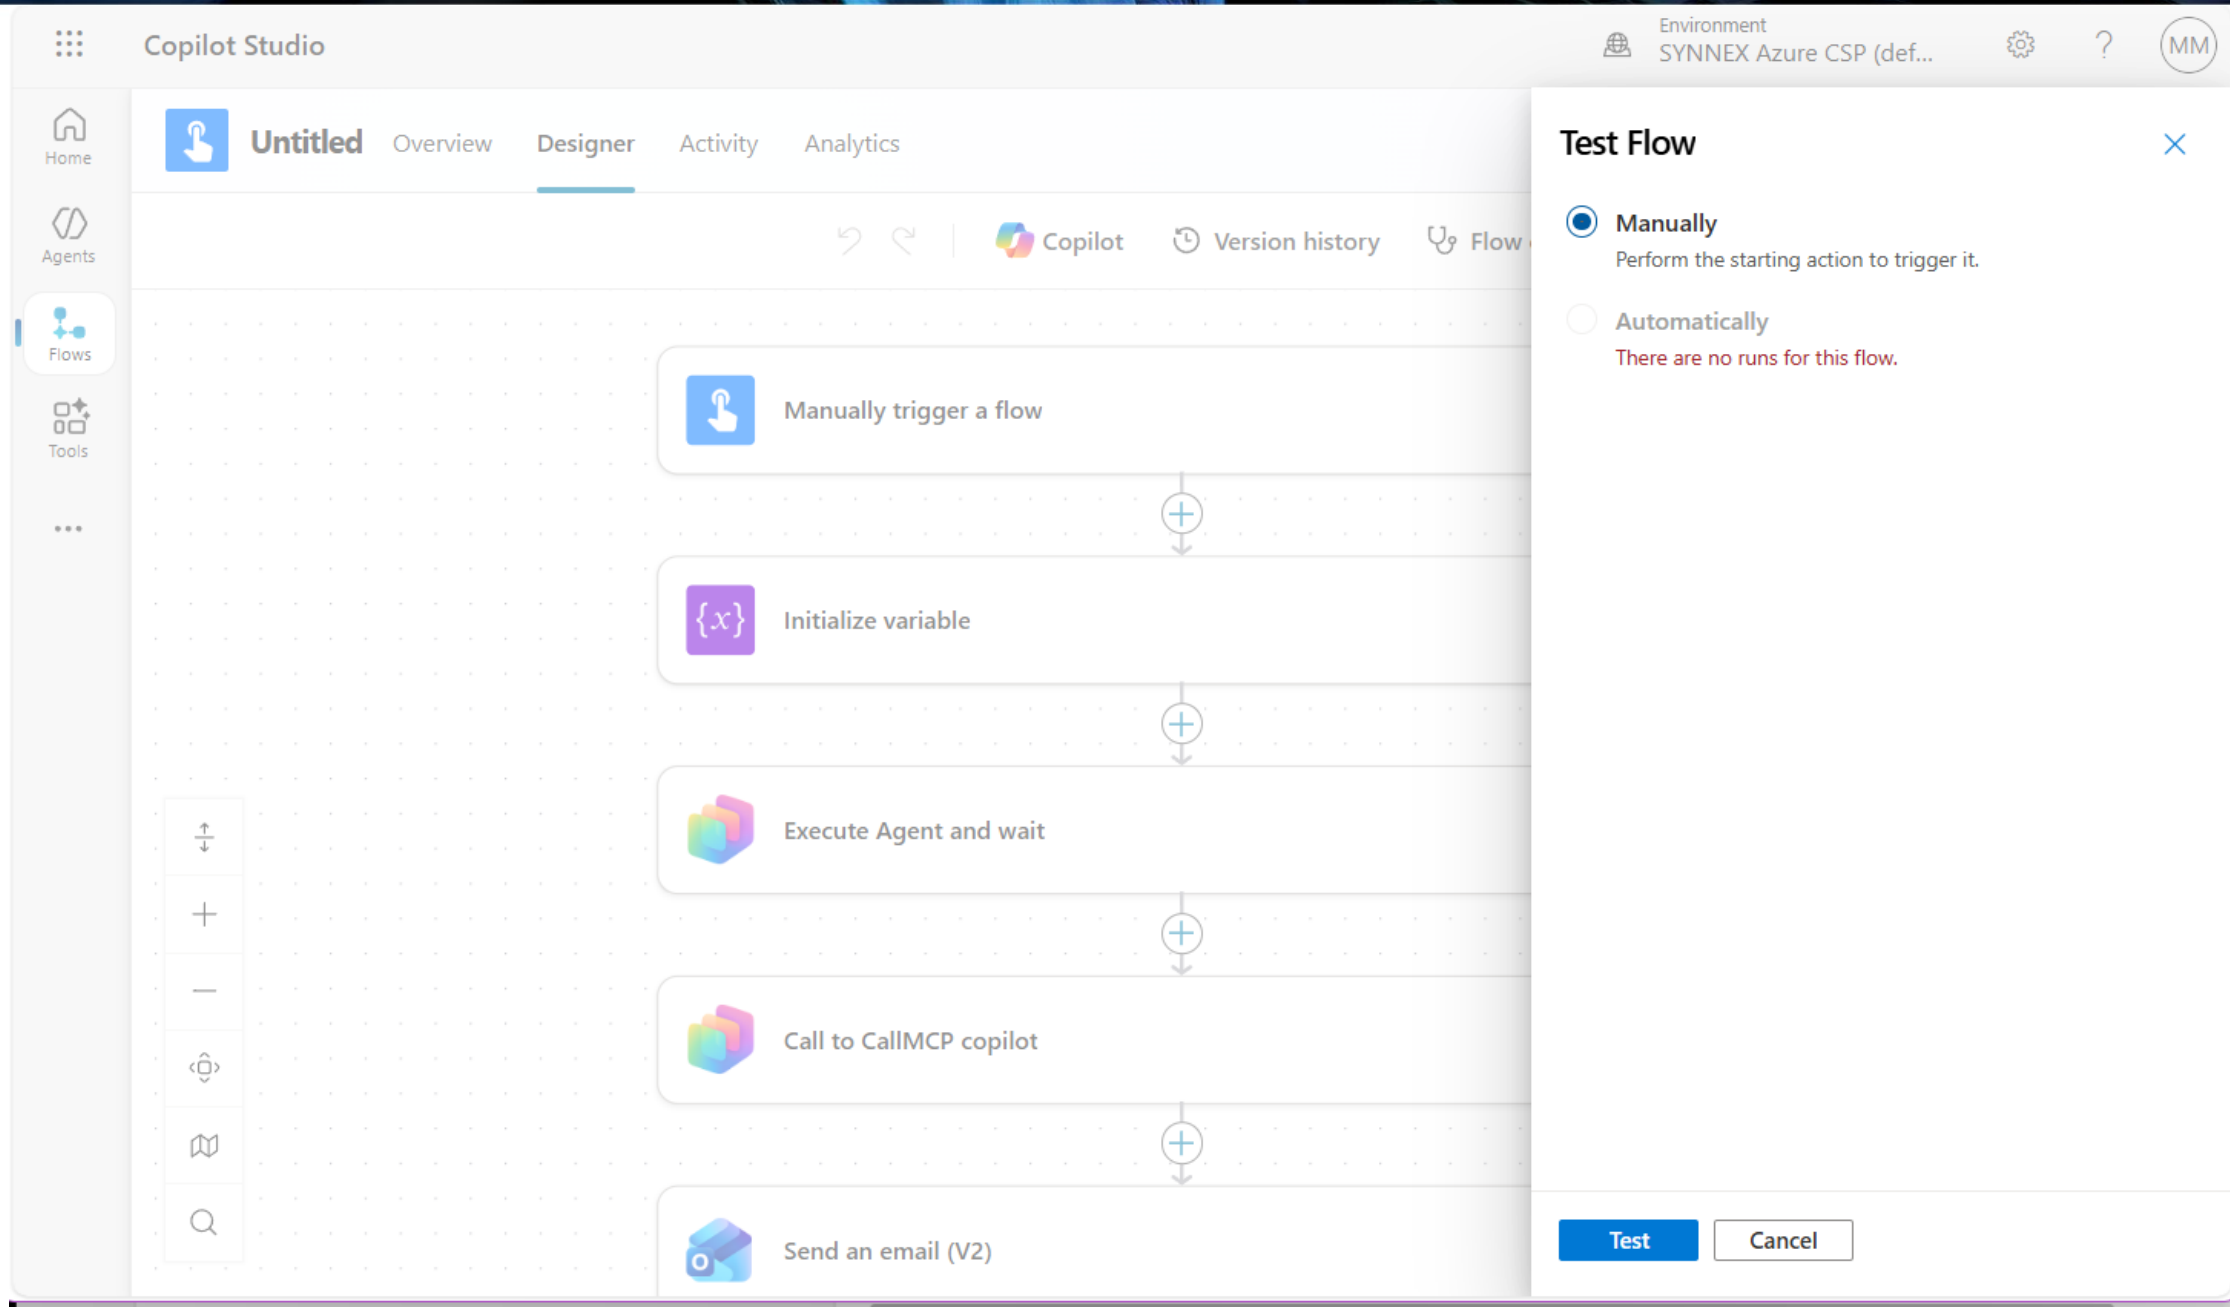

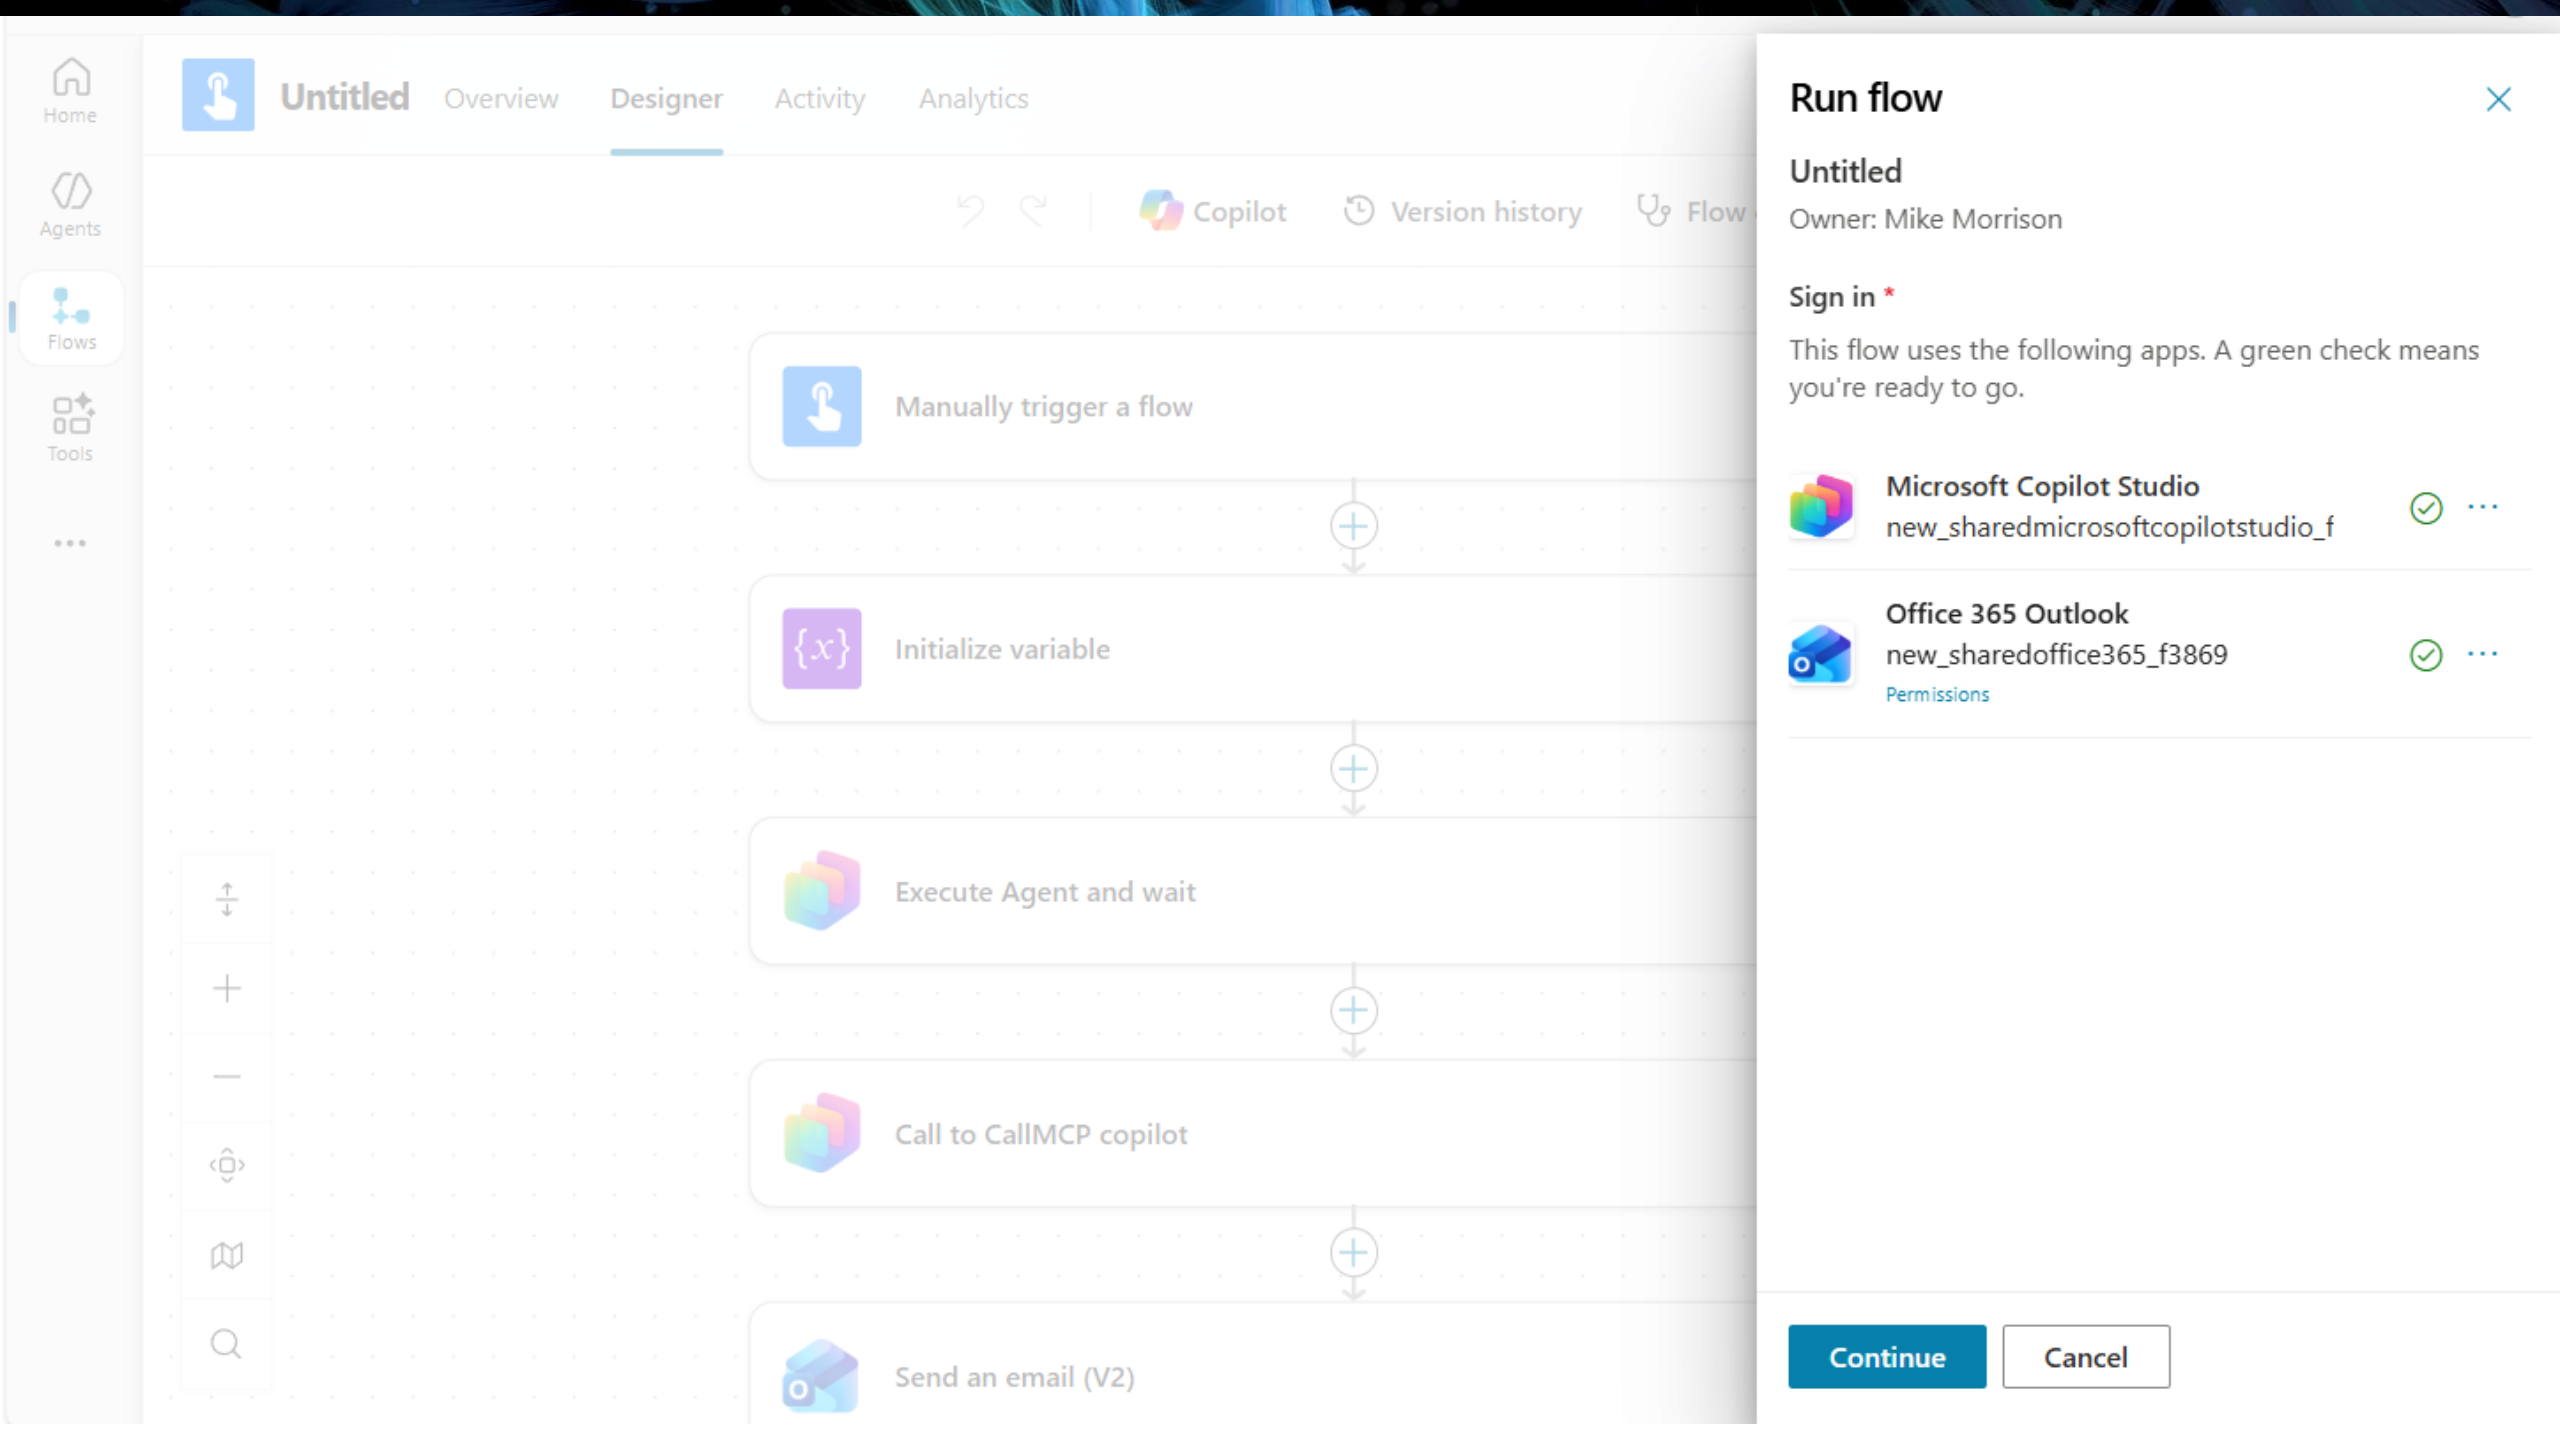

For this step, were going to use lastResponse from the 2nd agent Click Save and Publish

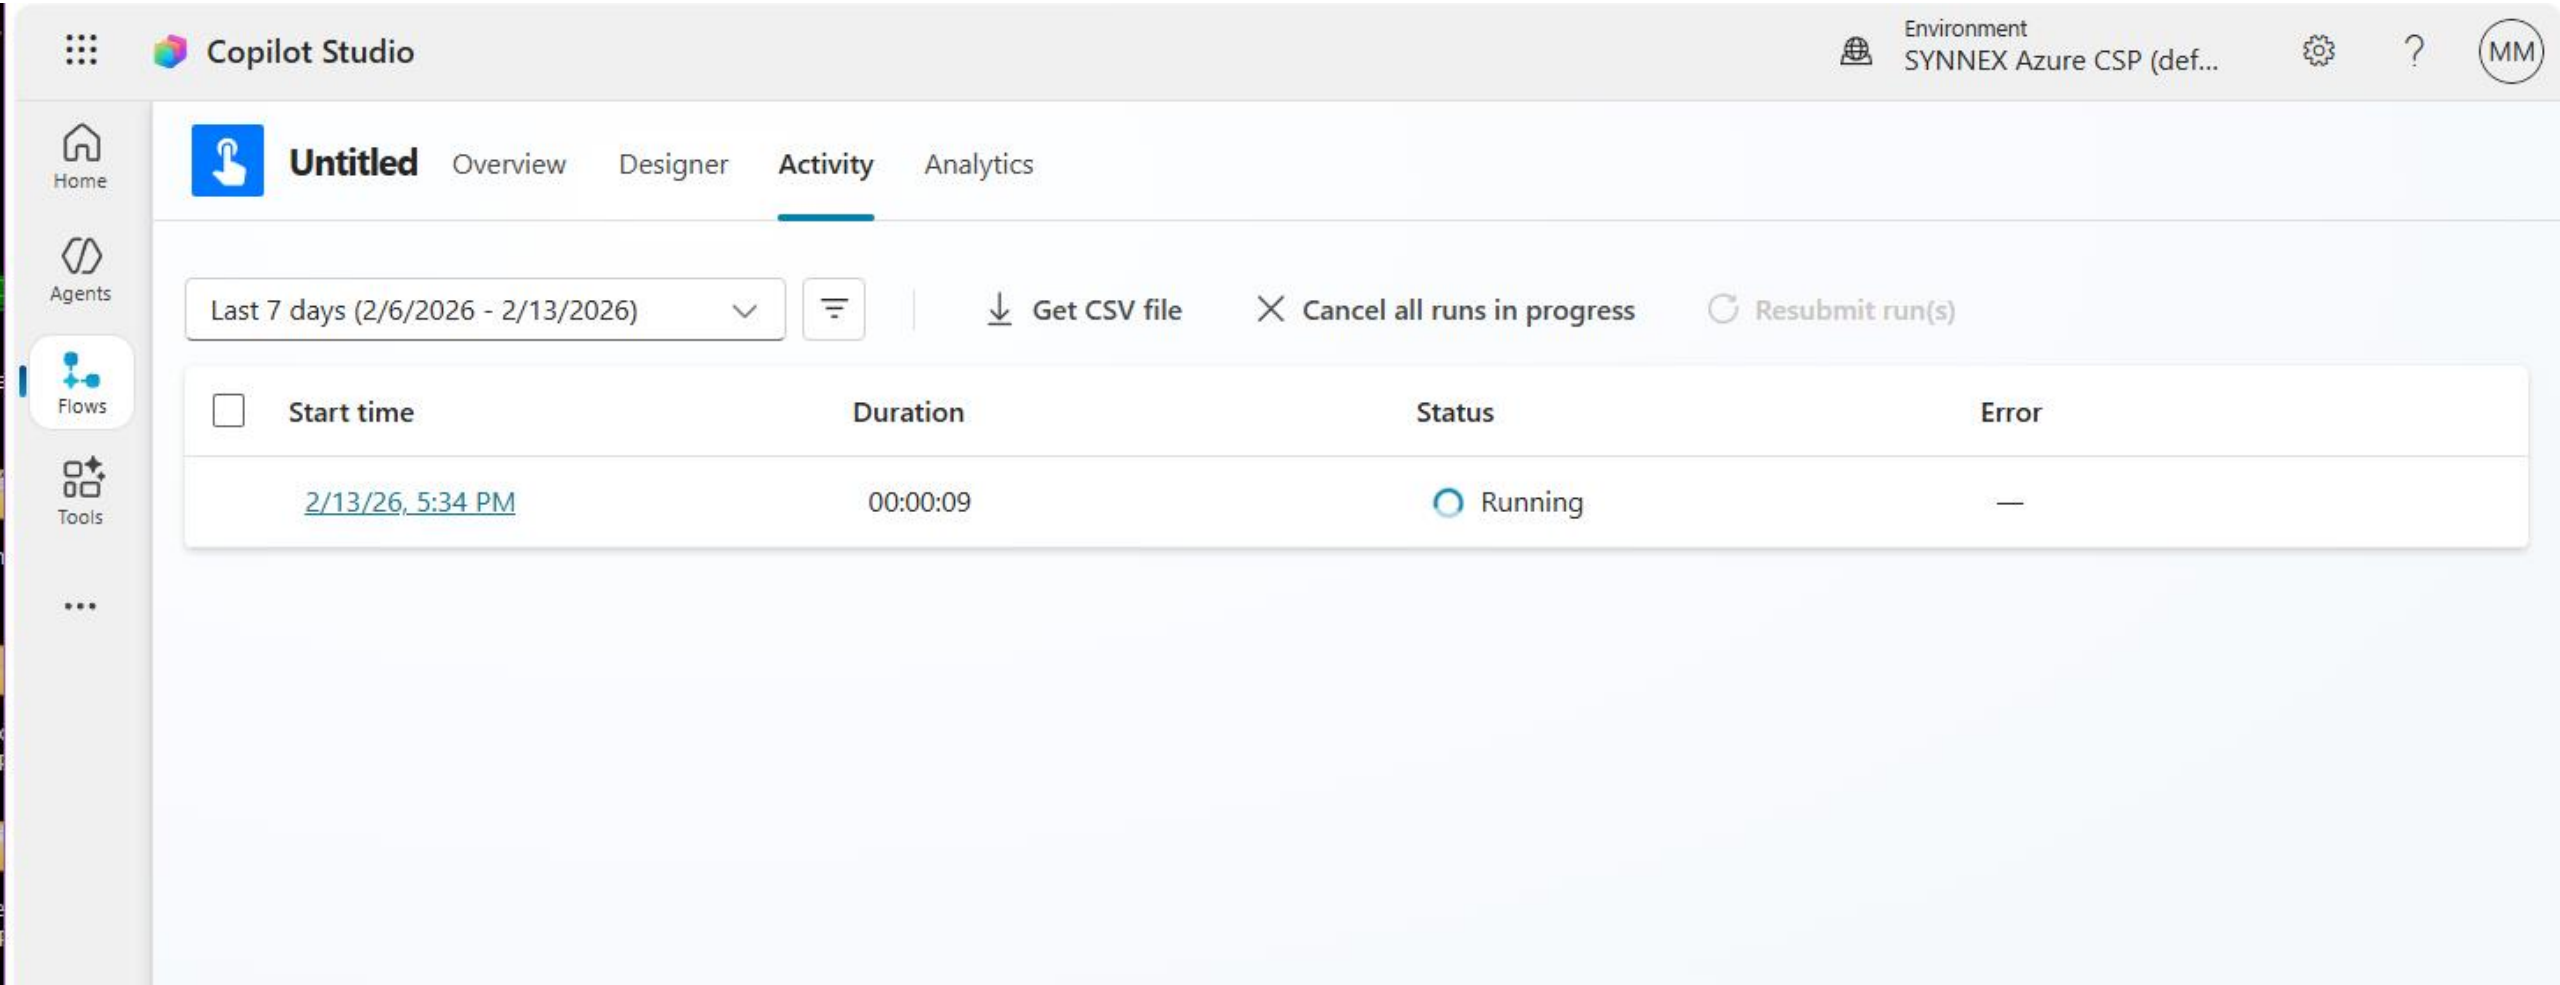

Now let's test it!

Mike Morrison <morrison@snxcsp.onmicrosoft.com> 5:34 PM (7 minutes ago)

to me

Fabric F4 Licensing Quote Requirements for Power BI To provide a quote for Fabric F4 licensing for Power BI, you should gather the following details: --- **1. Customer Details** - Organization: NEICC - Contact Person: Taylor (as referenced in the email) - Contact Information: (Include Taylor's email/phone if available) **2. Licensing Model** - Confirm that the F4 model for Fabric is requested. **3. User Count** - Number of users who will need access to the Fabric F4 environment. **4. Environment Details** - Any specific requirements for migration or setup (Taylor mentioned migrating the environment). **5. Timeline** - Desired start date for licensing and migration. **6. Additional Services** - Any support, training, or implementation services required. --- **Next Steps** - Set up a call with the customer to confirm details (they suggested after lunch today). - Gather the above information from NEICC to ensure an accurate and tailored quote. - If you have a standard quote request form, send it to the customer to expedite the process. If you need a template for the quote request or further details on Fabric F4 licensing, let me know!

Choosing Between AI Agent Options

- **M365 Copilot**

  vs

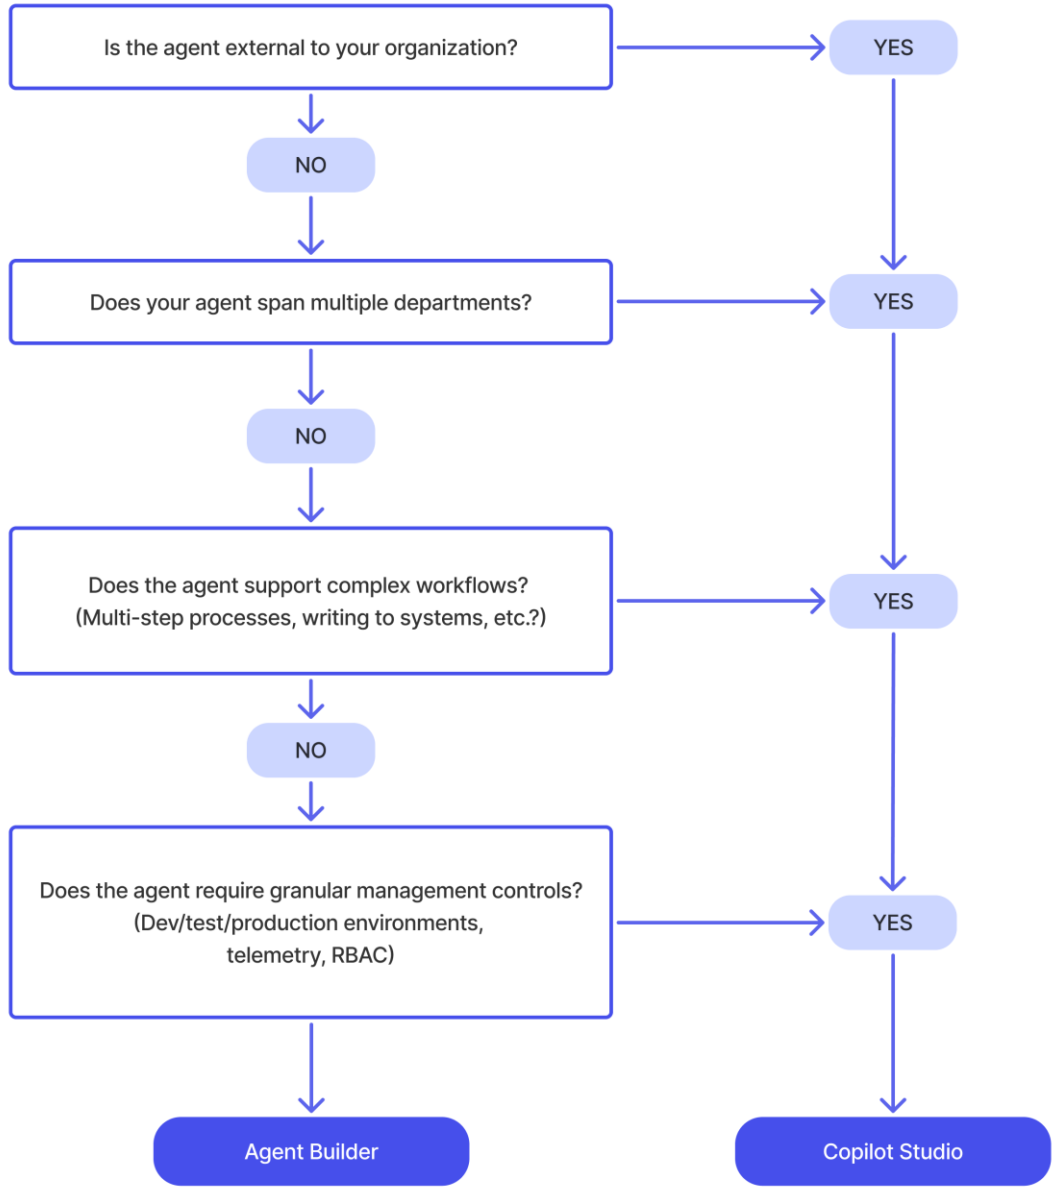

- **Copilot Studio Lite**

  vs

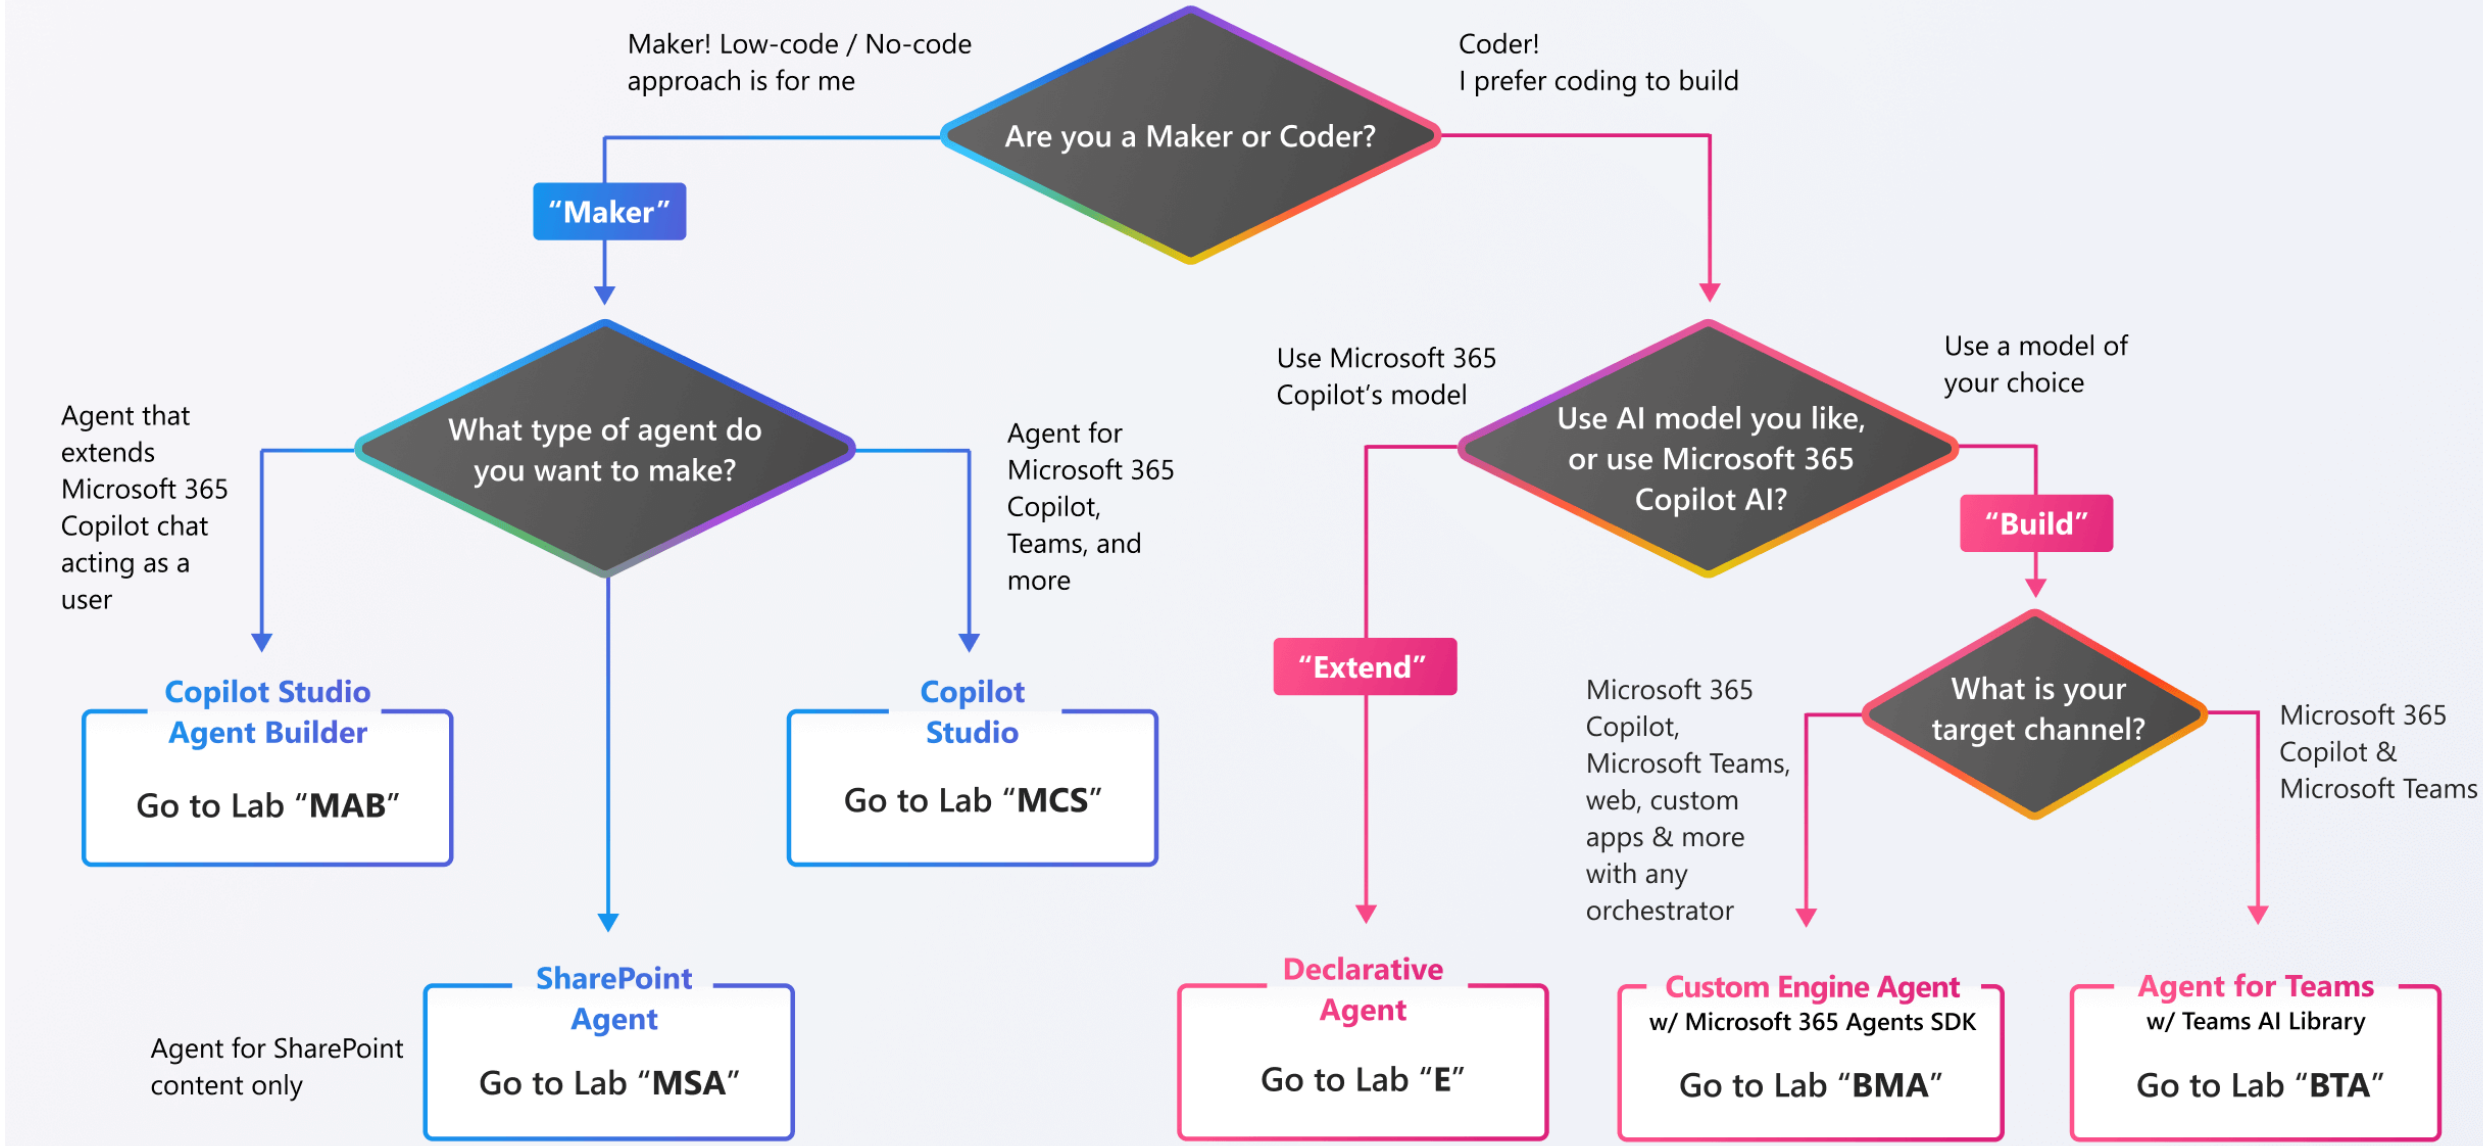

- **Copilot Studio**

  vs

- **vs Microsoft Foundry**

Is the agent external to your organization?
YES
NO
Does your agent span multiple departments?
YES
NO
Does the agent support complex workflows?
(Multi-step processes, writing to systems, etc.?)
YES
NO
Does the agent require granular management controls?
(Dev/test/production environments,
telemetry, RBAC)
YES
Agent Builder
Copilot Studio

Where should I start to build an agent?

Copilot Developer Camp https://microsoft.github.io/copilot-camp/

	M365 Copilot	Copilot Studio	Azure Foundry + OpenAI
Product			
Best Suited For	Business users and everyday professionals looking for in-app AI support	Power users and solution designers building copilots for business workflows	Dev teams and architects building enterprise-grade, embedded AI agents
Customization	Predefined features only; no control over logic or prompts	Custom prompts, flows, and logic using low-code tools	Full control over orchestration, memory, and behavior
Data Access	Integrated with Microsoft data (e.g., Outlook, CRM)	Connects to data via Power Platform connectors	Custom access via APIs, RAG, and vector embeddings
Where It Runs	Hosted by Microsoft inside M365/D365 apps	In your Power Platform environment and connected services	In your Azure infrastructure, tied to your app ecosystem
Cost Consideration	Included with most licenses; no extra infra cost	Billed by usage or capacity in Power Platform	Usage-based pricing via Azure (tokens, compute, storage)

Pro Code Licensing

There are currently over 11,000 models available to Microsoft Foundry to use.

= it depends

Foundation Models

Azure foundation models are large, pre-trained AI models—mostly large language models (LLMs) and multimodal models—hosted and served through **Azure AI Foundry** and **Azure Machine Learning**.

Foundation models in Azure **do not ingest, store, or remember your data**. Instead, Azure uses a **retrieval pipeline** around the model. This is the same pattern used in Copilot Studio's RAG pipeline, because both run on Azure AI Foundry infrastructure.

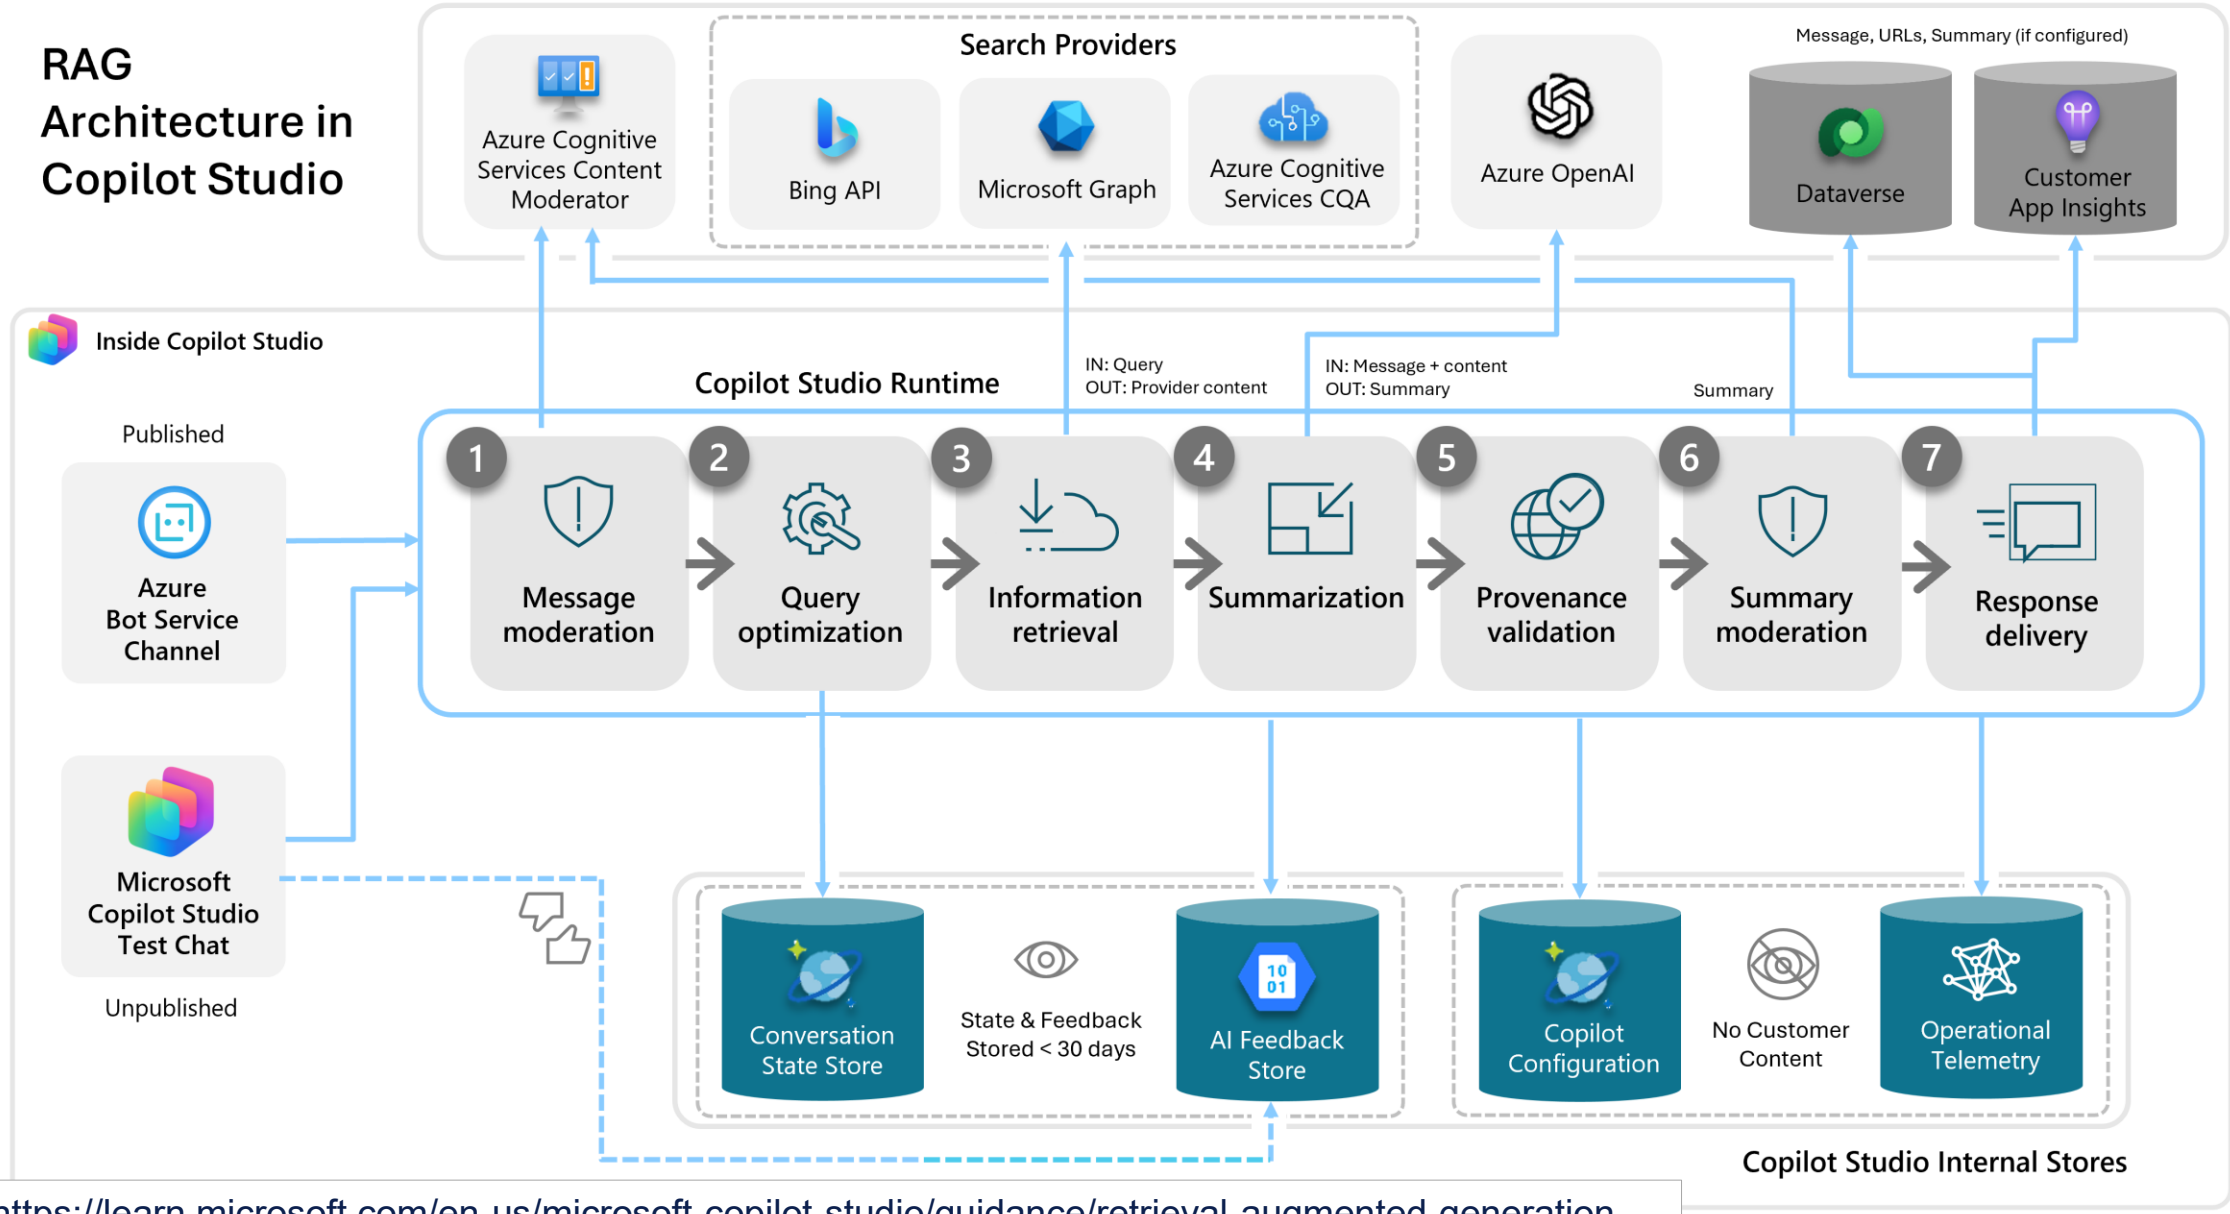

How RAG works in Copilot Studio

RAG in Copilot Studio follows a four-step process:

- **Query rewriting** - optimizes the user's question before searching
- **Content retrieval** - runs against all the knowledge sources, pulls top 3 from each store.
- **Summarization and response generation** - AI synthesizes retrieved content/Personalizes responses by using user context
- **Safety and governance validation** - Grounding validation and removal of incorrect information

https://learn.microsoft.com/en-us/microsoft-copilot-studio/guidance/retrieval-augmented-generation

RAG Architecture in Copilot Studio

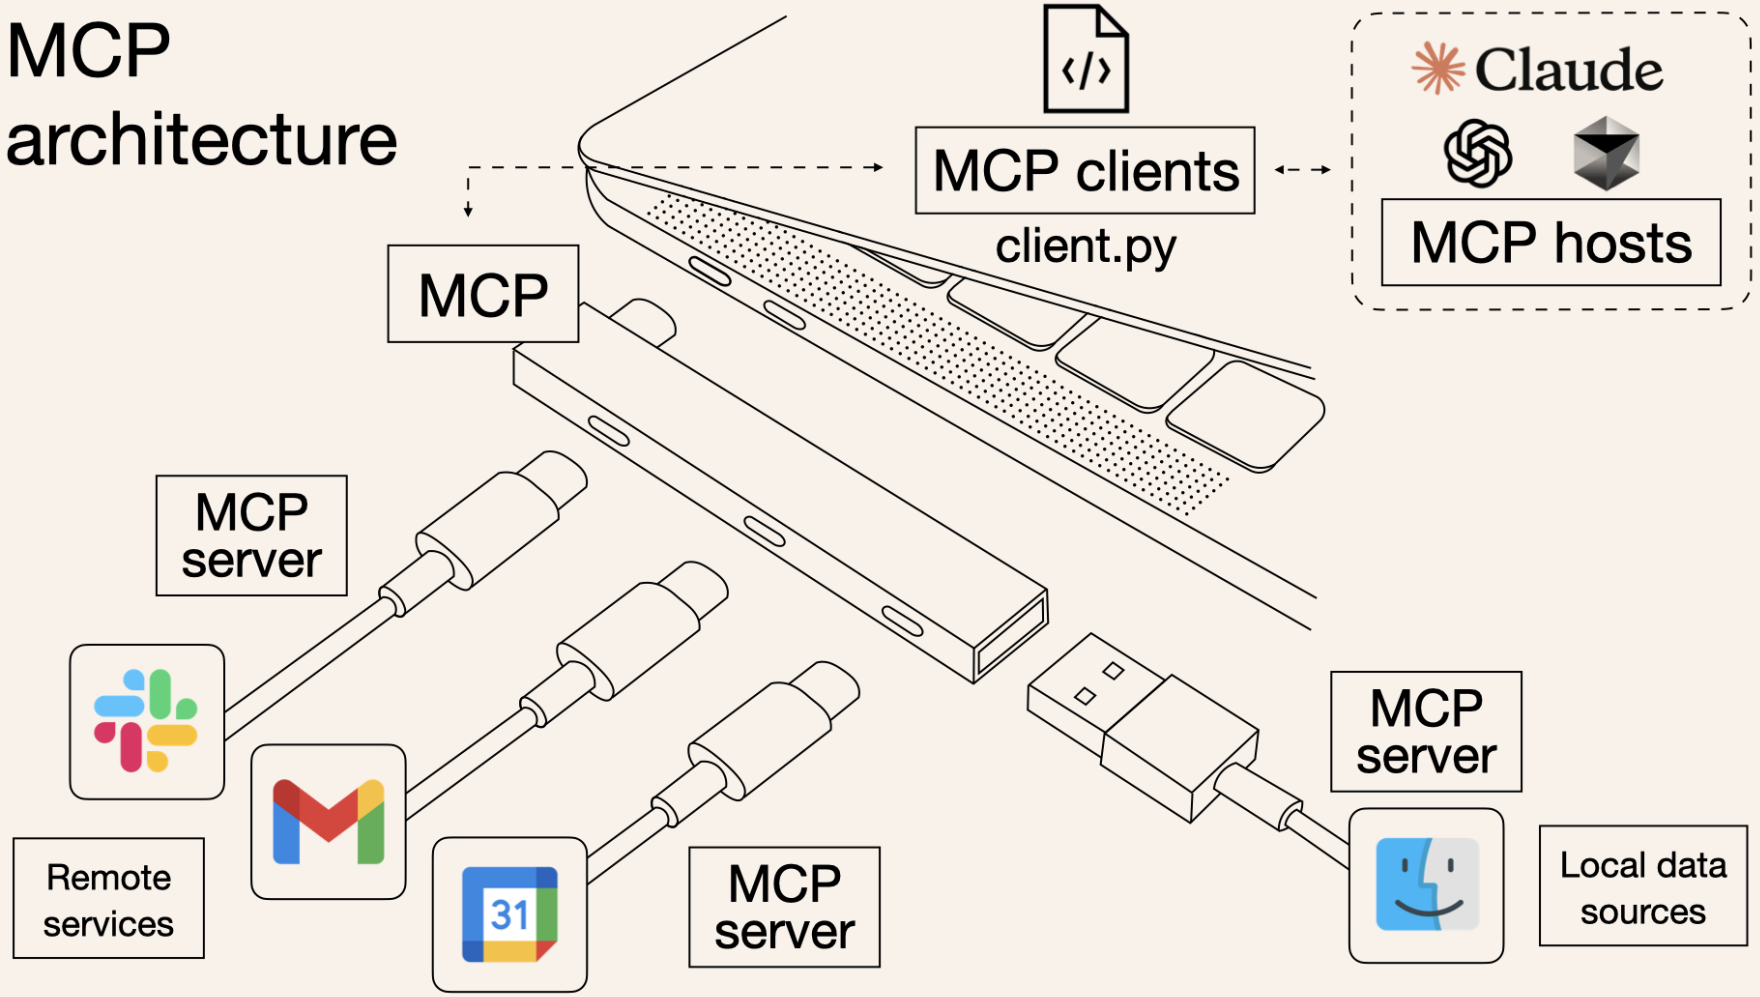

https://learn.microsoft.com/en-us/microsoft-copilot-studio/guidance/retrieval-augmented-generation

Model Context Protocol integration

Model Context Protocol (MCP) enables makers to connect to existing knowledge servers and APIs directly from Copilot Studio. When connecting to an MCP server, actions and knowledge are automatically added to the agent and updated as functionality evolves. This simplifies the process of building agents and reduces time spent maintaining the agents.

MCP is a standardized protocol that connects AI agents to various external tools and data sources. Imagine it as a USB-C port - but for AI applications.

The MCP connectors currently available in Copilot Studio include:

- Dataverse
- Dynamics 365
  - Sales
  - Finance
  - Supply Chain
  - Service
  - Enterprise Resource Planning (ERP)
  - Contact Center
- Fabric
- Kusto Query
- Office 365 Outlook
  - Contact Management
  - Email Management
  - Meeting Management
- GitHub
- Learn docs MCP

  - Microsoft Outlook Mail MCP
  - Microsoft 365 User Profile MCP
  - Microsoft Outlook Calendar MCP
  - Microsoft Teams MCP
  - Microsoft SharePoint and OneDrive MCP
  - Microsoft SharePoint Lists MCP
  - Microsoft 365 Admin Center MCP
  - Microsoft Word MCP
  - Microsoft 365 Copilot (Search) MCP

Copilot Studio Lite

Why choose Copilot Studio Lite?

- ✓ Want to get started with AI, but don’t have a scenario to optimize for
- ✓ Internal use only, handful of users
- ✓ Low barrier to entry
- ✓ Deploy an agent as quickly as possible
- ✓ We simply want to use it/try it
- ✓ SharePoint agents also included here
- ✓ Advanced MSFT Agents like Researcher/Analyst (M365 Copilot)

Microsoft Copilot Studio

Why choose Copilot Studio?

- ✓ Need/want more control
- ✓ Need to use data connectors
- ✓ Want Agents to interact with your non-MSFT applications
- ✓ Deployment to non-M365 Channels (Website, Mobile App)
- ✓ Flexible logic + orchestration
- ✓ Scalability

Generative AI in Copilot Studio

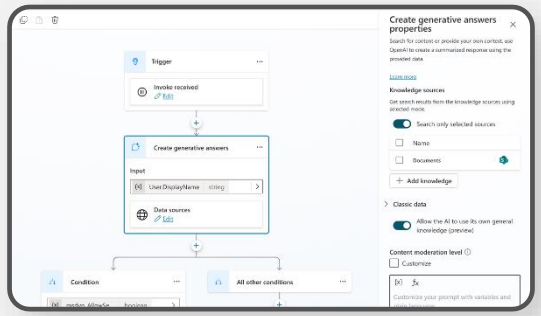

Powered by Azure

CONNECT AND EXTEND

M365 Copilot | Azure AI Foundry | Power Apps | Power Pages | Teams | Dynamics 365

Generative Conversations

Generative Answers

Copilot Studio boosts conversational coverage by dynamically generating multi-turn answers based off an organization's content in real-time in response to unanticipated questions

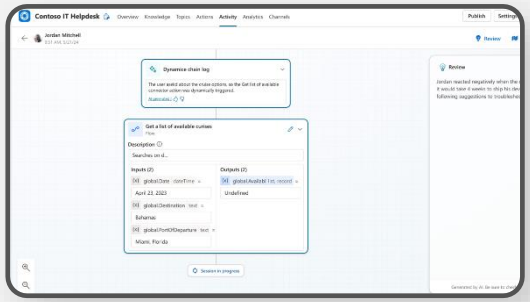

External

- 3P Search APIs
- External URL

Internal

- OneDrive URL
- Documents
- SharePoint URL

Generative Actions

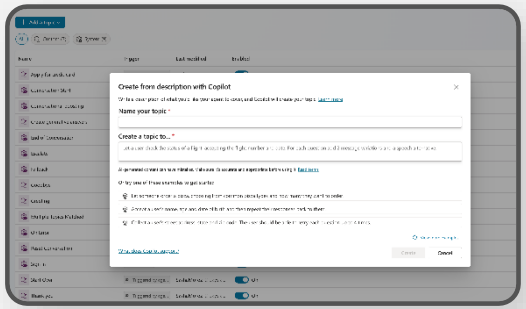

Copilot Studio generates dialog and takes action through dynamically chaining existing building blocks which can handle queries that were not anticipated or previously built

Tools

- Power Platform Connectors
- Topics
- Skills
- Power Automate Flows

Generative Assistance

Generative building

Assisted authoring to build, design and modify agents through natural language

Edit & Refine

- Topics
- Trigger Phrases
- Entities
- Variables
- Adaptive Cards
- Branching

Azure AI Foundry

Why choose AI Foundry

- ✓ Maximum control and flexibility
- ✓ Custom orchestration + deployment
- ✓ Advanced integrations
- ✓ Professional developers
- ✓ Precise LLM behavior

Governing and Administering Copilot Studio

Copilot Studio-specific Governance & Administration

Copilot Studio has some governance and administration features that are unique to the tool

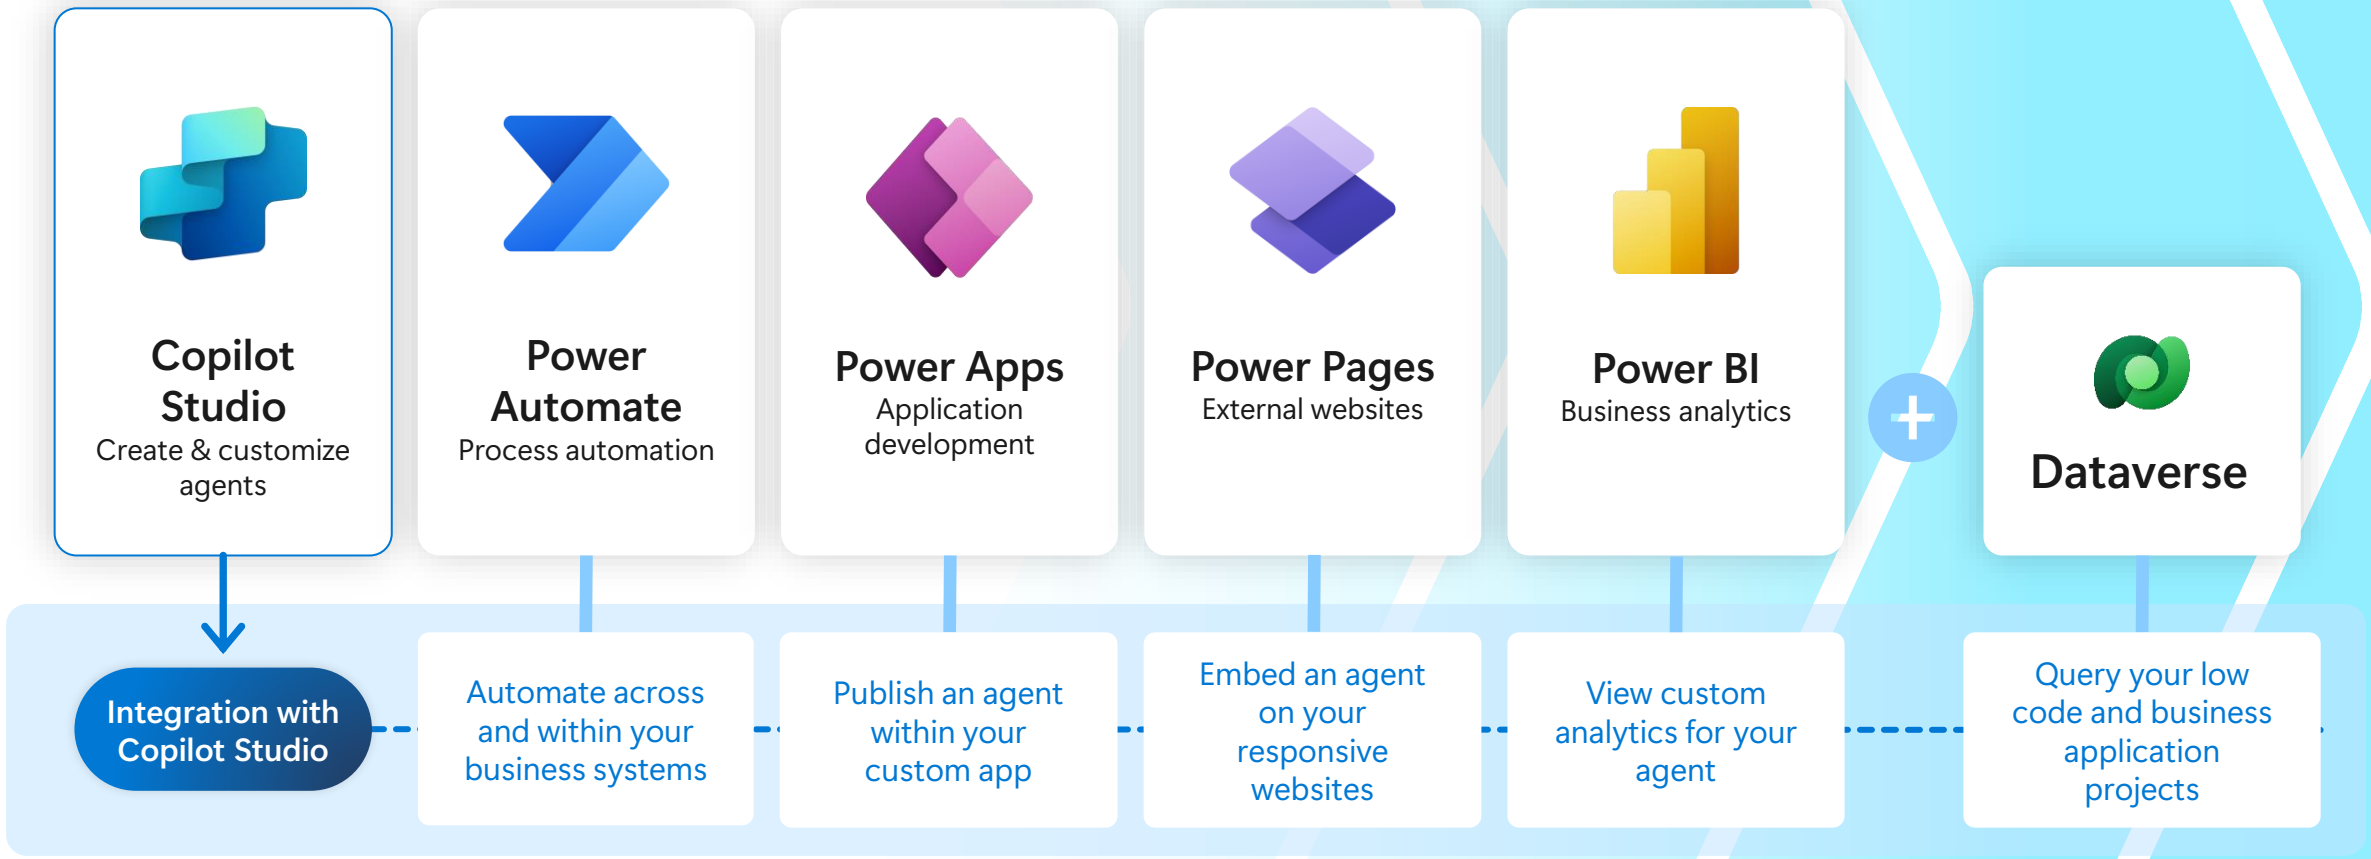

Governance & Administration through Power Platform

Because Copilot Studio is a tool within Power Platform, many governance and administration features exist within the platform

Copilot Studio is a member of the Power Platform

Many governance and administration capabilities for Copilot Studio exist in the Power Platform

Feedback

Tenant Management

- DO NOT use default environment for production!
  used for testing/experimentation
- Adopt dev/test/prod style environment structure
- Restrict environment creation to admins
- Could do formal request process for new environments
- Use group-based roles and least privilege access
- Audit agent/environment inventory over time

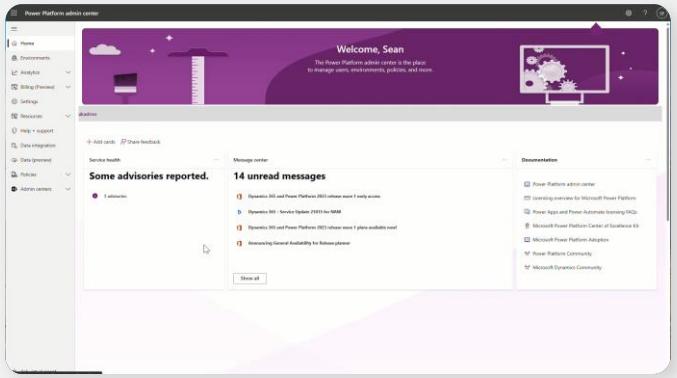

Why not use the default Environment

- Limited Customization Control
- Risk of Unintended Changes
- Security Concerns
- Scalability and Performance
- Versioning and Release Management
- Governance Challenges
- Collaboration Constraints
- Resource Contention

https://global-sharepoint.com/sharepoint/power-platform-default-environment/

The right tools for your governance requirements

Power Platform Admin Center

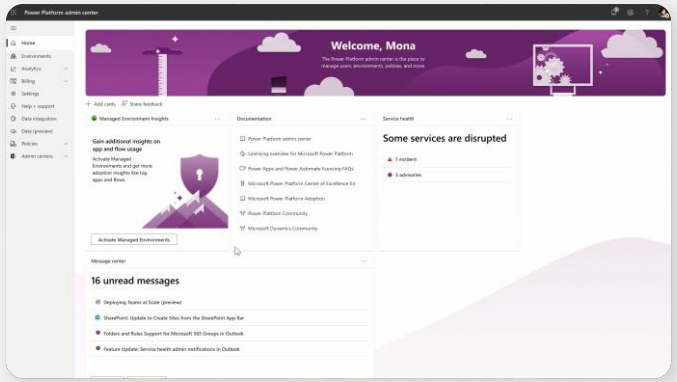

Standard governance offering

Build guardrails around data, agents, and environments

View analytics on low code assets across your organization

Managed Environments for Power Platform

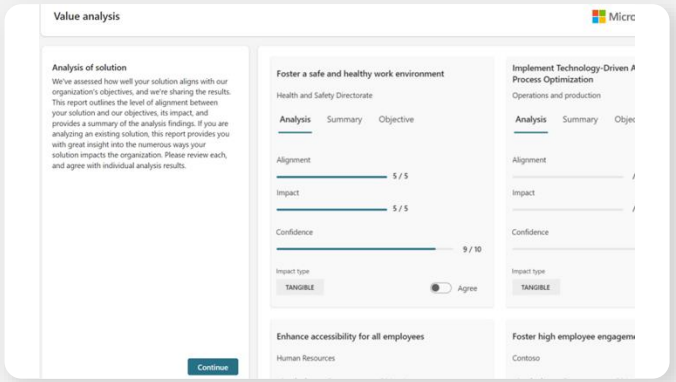

Premium governance offering

Enable governance-at-scale without additional IT resources

Proactively build and enforce best practices while gaining key insights and analytics

Center of Excellence Kit

Extensible governance add-on

Enhance your governance journey with powerful open-source tools

Drive innovation and improvement faster

Managed Service: Center of Excellence

As your customers use Microsoft Power Platform to enable citizen developers across their organizations, they also seek capabilities to **govern and monitor usage**

The Microsoft Power Platform CoE Starter Kit is a collection of components and tools that are designed to **help organizations develop a strategy** for adopting and supporting Power Platform

CoE Starter Kit features for Copilot Studio

- Keep track of the number of conversations per agent over time, with daily aggregates
- Allocate a number of conversations per environment
- Receive capacity email alerts when environment add-ons get near or over their allocated number of conversations
- Get an overview dashboard of Copilot Studio usage in a tenant over time as well as an all-up conversation consumption versus allocation

Questions to discuss

- Do you plan to use the Center of Excellence Starter Kit to delivered a managed service for the agents in your customer's tenant?
- Do your customers have specific governance requirements such as charge-back models?
- Do you allow your customer's users to create agents using Copilot Studio for Teams?
- Do you allow your customer's users to create Copilot Studio trials, or do you want them blocked?

How can I control generative AI capabilities in Copilot Studio?

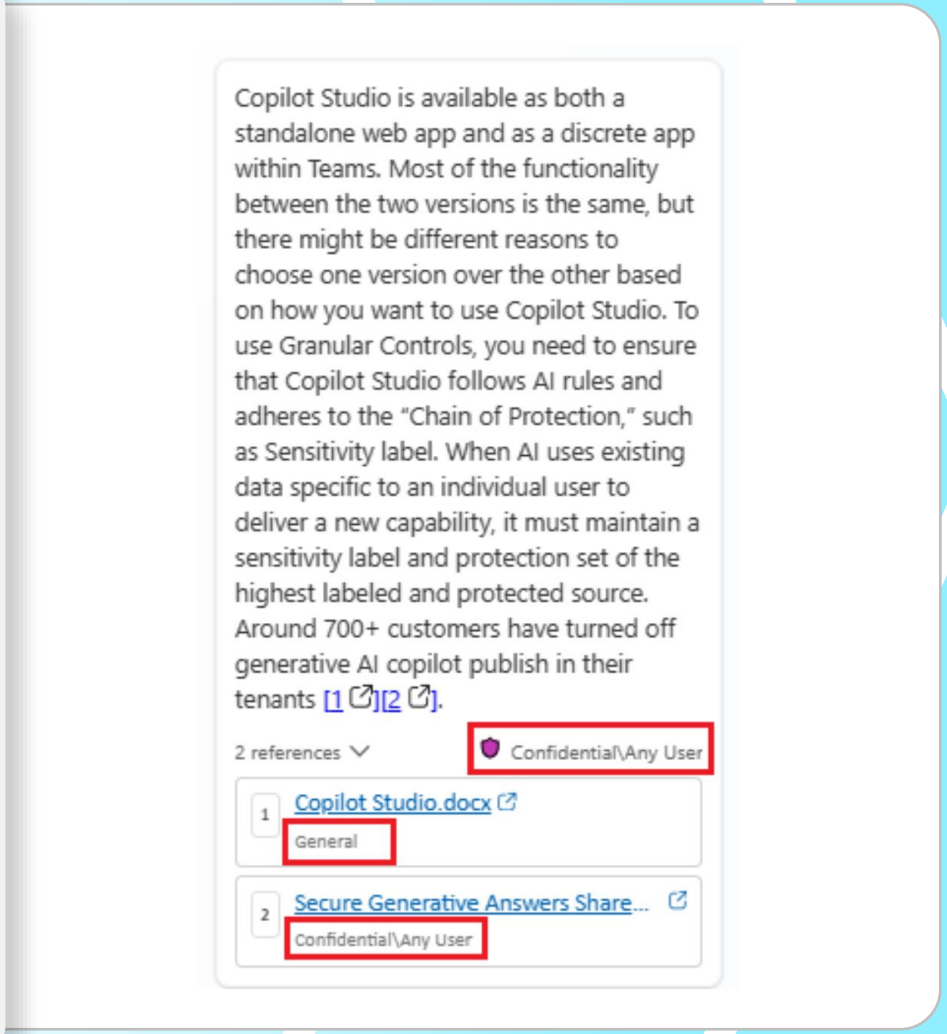

Copilot Studio provides granular and tenant-level governance controls for custom copilots in your organization. Use the Power Platform admin center to

- Make publishing of custom copilots available or unavailable, at the tenant level.
- Control whether custom copilots can use public URLs as knowledge sources, at the environment level.
- Allow data movement across geographic locations for generative AI features, at the environment level.

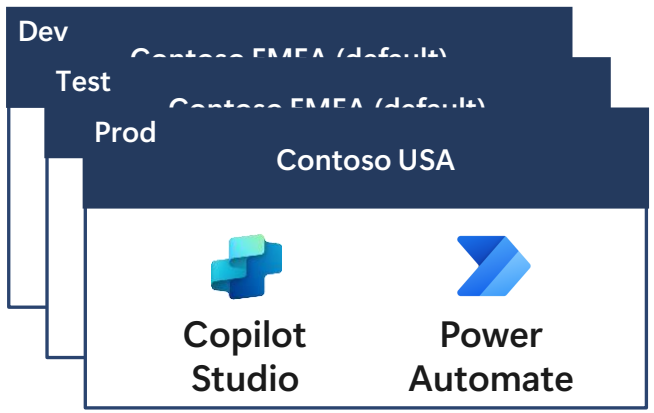

Copilot Studio sensitivity labels (Preview)

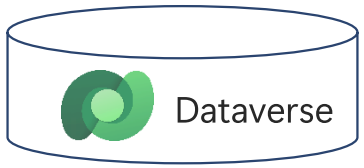

Microsoft Copilot Studio supports the sensitivity labels for SharePoint and OneDrive data sources for knowledge or generative answers classic. This capability from Microsoft Purview strengthens your data security and compliance for Microsoft Copilot Studio.

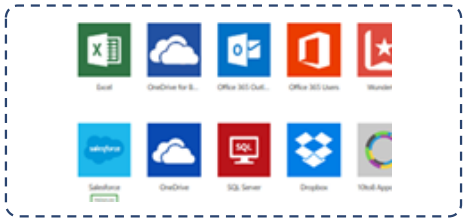

Copilot uses existing controls to ensure that data stored in your tenant is never returned to the user or used by a large language model (LLM), if that user doesn't normally have access to that data. When the data has sensitivity labels from your organization applied to the content, there's an extra layer of protection.

Managing access for copilot developers

Contoso Corp.

1. Azure Conditional Access
2. Environment roles
3. Resource permissions for copilots, flows, custom connectors...
4. Dataverse security roles
5. Cross-tenant inbound & outbound restrictions to the 300+ connectors to cloud services, content services, DBs, APIs, etc.

Environments

Create, manage, and monitor

Specify your region

Secure access to the environment by selecting which user groups can access the environment

Define Security roles for the environment

Makers can create and share apps, connectors, gateways etc. in the environment

Admins have complete ability to customize and administer the environment

Environments

An environment is a space to store, manage, and share your organization's business data, apps, chatbots, and flows. When an environment is managed, it allows you greater visibility and control.

Environment	Type	State	Dataverse	Mana
AppInsights	Sandbox	Ready	Yes	No
TestEnv Dec 2025	Sandbox	Ready	Yes	No
CopilotStudioBillToAzure	Production	Ready	Yes	No
Thor's_Place	Sandbox	Ready	Yes	Yes
SYNNEX Azure CSP (PROD)	Production	Ready	Yes	Yes
ClemsonCapstoneF25	Production	Ready	Yes	No
Microsoft 365 Copilot Chat	Production	Ready	No	No
PipelineTarget	Production	Ready	Yes	Yes

Copilot Studio security roles

Overview of standard Dataverse security roles and impact on Copilot Studio

Security Role/Table	Chatbot bot	Chatbot Subcomponent botcomponent	Conversation Transcript conversationtranscript
System administrator	Org (CRUD)	Org (CRUD)	Org (CRUD)
System customizer	Org (CRUD)	Org (CRUD)	Org (CRUD) Soon none
Environment maker	User (CRUD)	User (CRUD)	None
Bot Transcript Viewer	None	None	User (Read)
Bot Author (deprecated)	User (CRUD)	User (CRUD)	User (CRU)
Bot Contributor (deprecated)	User (Read)	User (CRUD)	None
Omnichannel administrator	Org (Read)	None	None

How are Copilot Studio records secured in Dataverse?

- When a chatbot is created, a team gets also created and the chatbot is shared with that team.
- Chatbot subcomponents (e.g., topics, entities, files, etc.) are shared with the same team.
- Conversation Transcripts are implicitly shared with their parent Chatbot's team, but only users that have a read access on the Conversation Transcript table can access them.

- These security roles grant permissions to Copilot Studio configuration and data tables in Dataverse
- To start creating and working on copilots, users can be assigned the standard Environment Maker security role. With this role, users only see their own copilots or the copilots that have been shared with them. If too permissive, custom roles may also be used
- The Environment Maker role also lets users create other related Power Platform components (e.g., solutions, cloud flows, connection references, environment variables, etc.)
- To see transcripts, users must be granted at least one role giving read access to the Conversation Transcript table

Useful resources

- Use group teams to assign security roles
- Security concepts in Dataverse
- Chatbot (bot) table/entity reference
- Chatbot subcomponent (botcomponent) table/entity reference
- conversationtranscript table/entity reference

Application lifecycle management (ALM)

First and foremost, ensure your team is checking into source control

Copilot Studio ALM is like the rest of the Power Platform

Your agent is packaged together with dependencies (Power Automate Flows, connectors) into a solution

A solution file is a .zip, unzip it and check it in

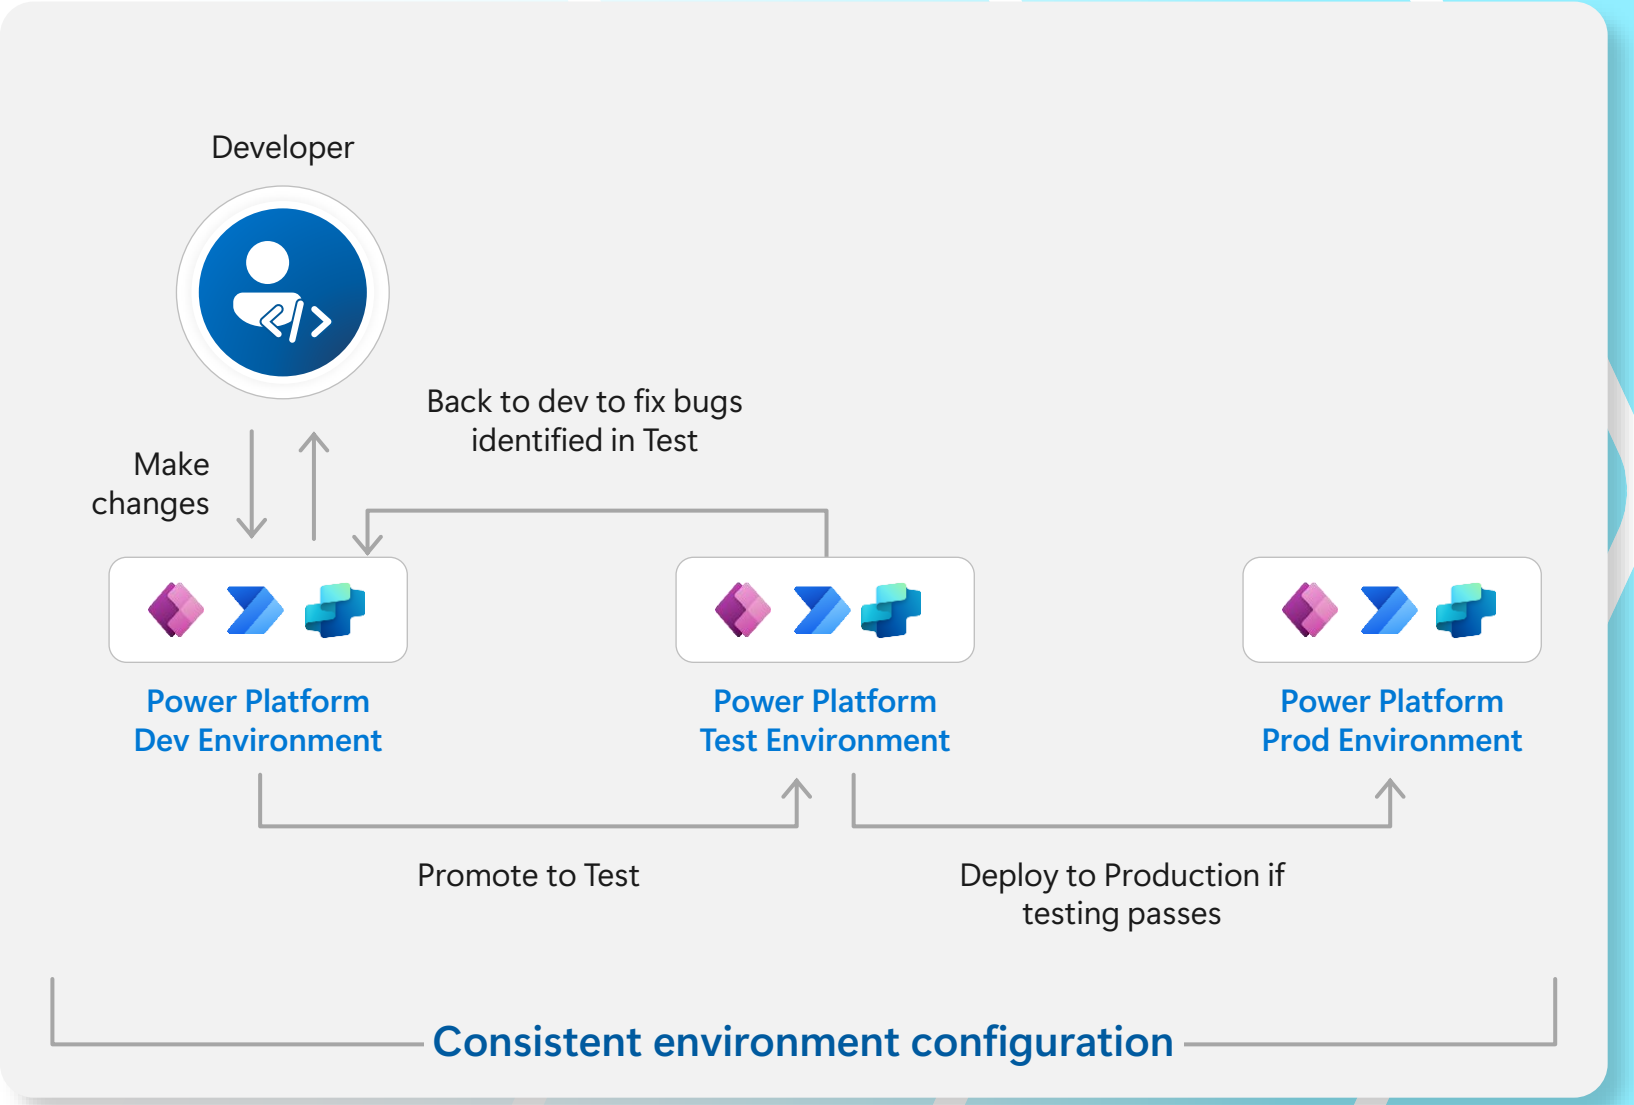

Lots of further reading:
[Application lifecycle management (ALM) with Microsoft Power Platform]

Power Platform ALM

Makers have agent lifecycle management requirements – Governance, development, and maintenance

Makers can export and import agents across multiple environments – Development, test and production

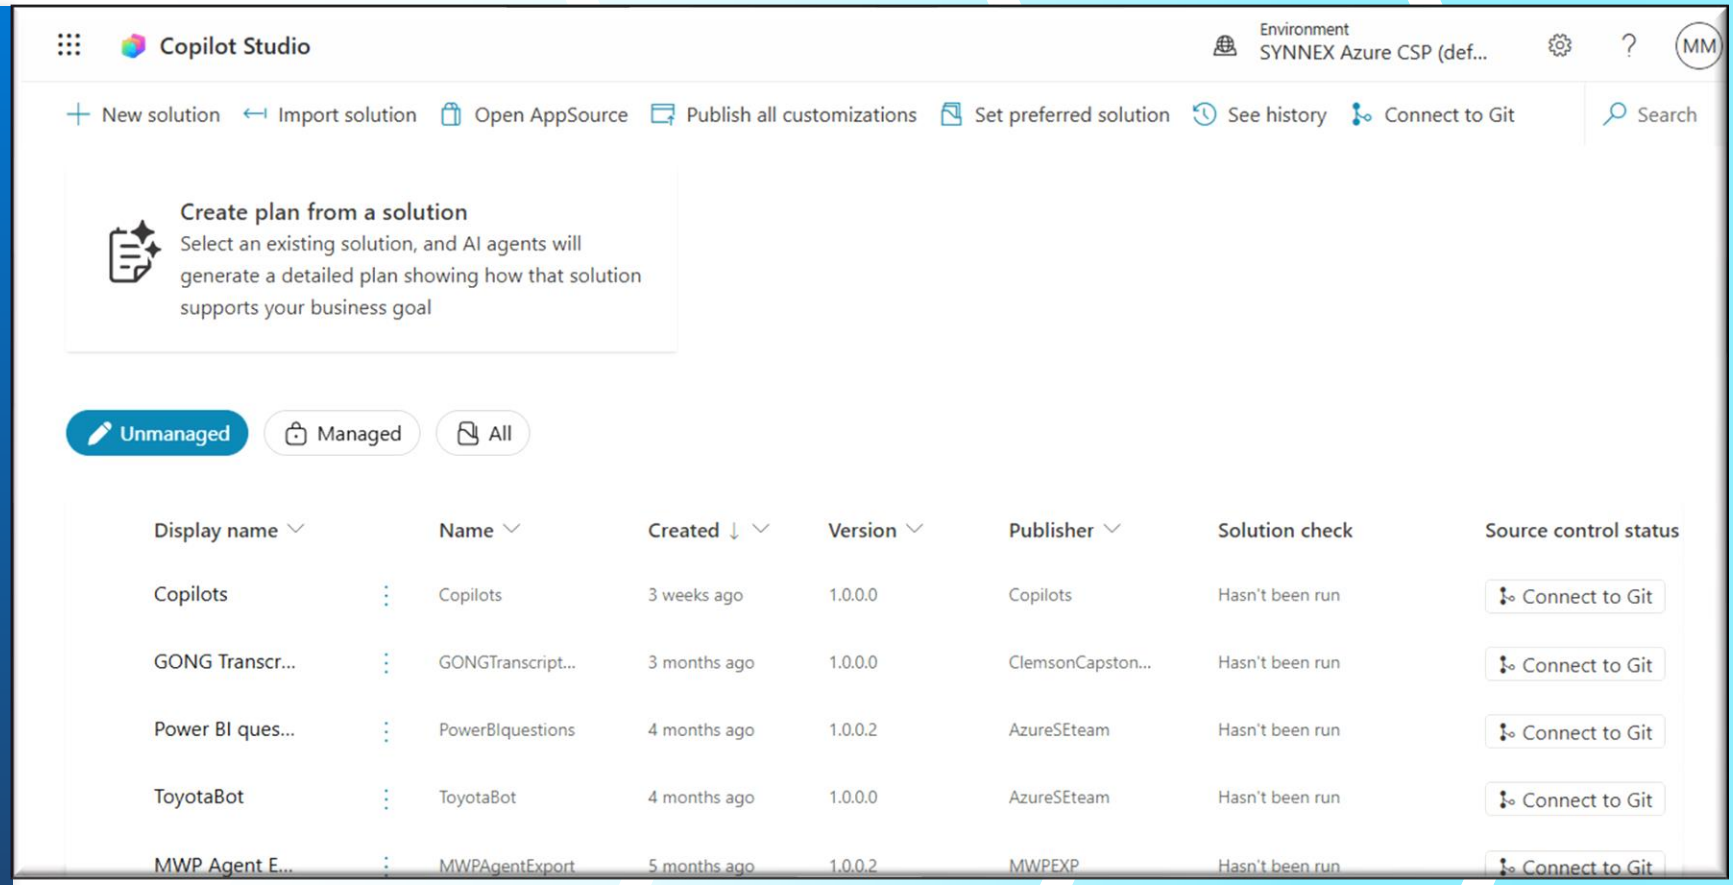

Power Platform ALM

Solutions are the default packaging tool for bundling Apps, Flows, Copilots, Tables, etc.. Into a portable “package” of related elements.

This allows

- Versioning for easy rollback and deployment
- Easy pipeline deployments across Dev->QA->Prod
- Integration with Code Repositories
- Shipping and monetizing and these solutions

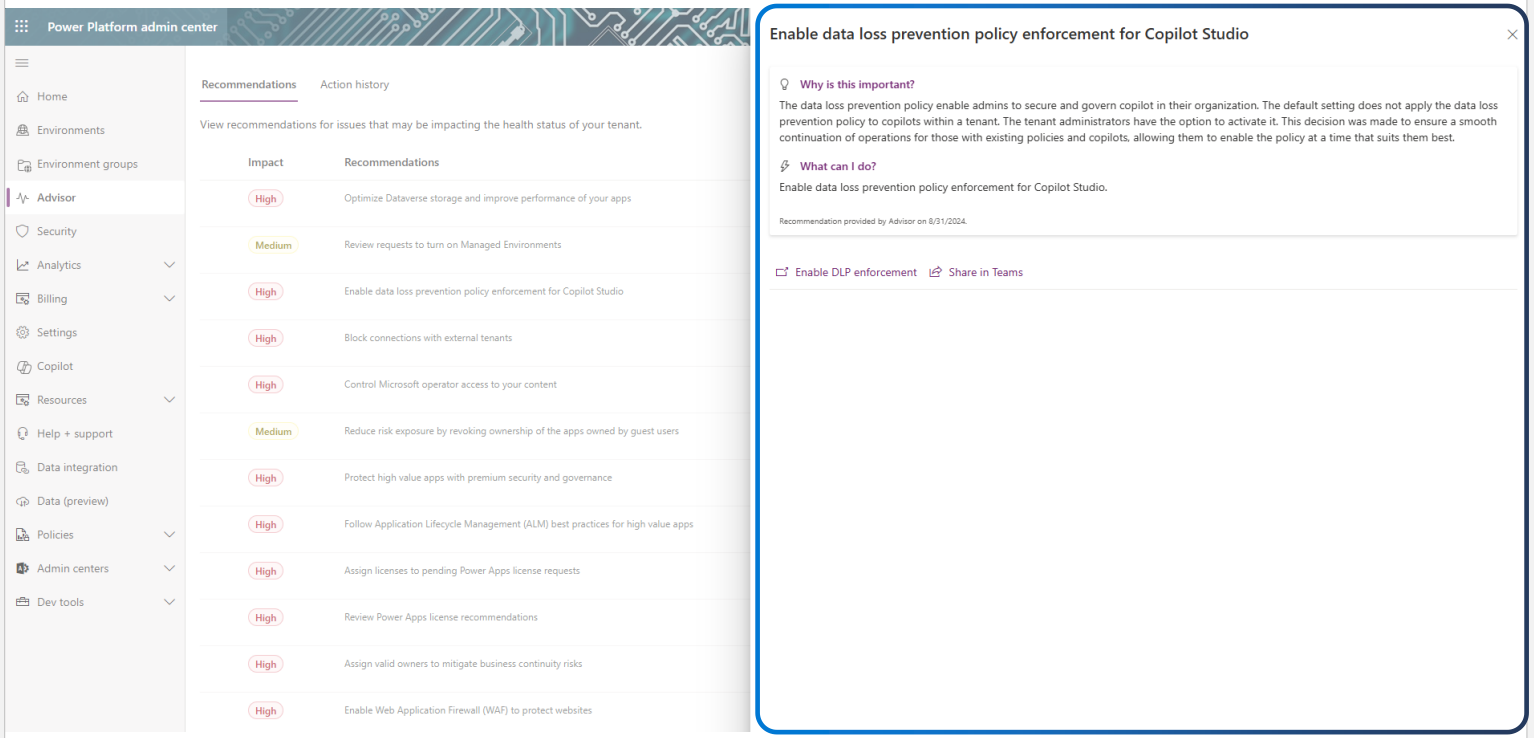

New

Advisor recommendations for copilots

Generally available

Enforce data loss prevention policy for Microsoft Copilot Studio copilots

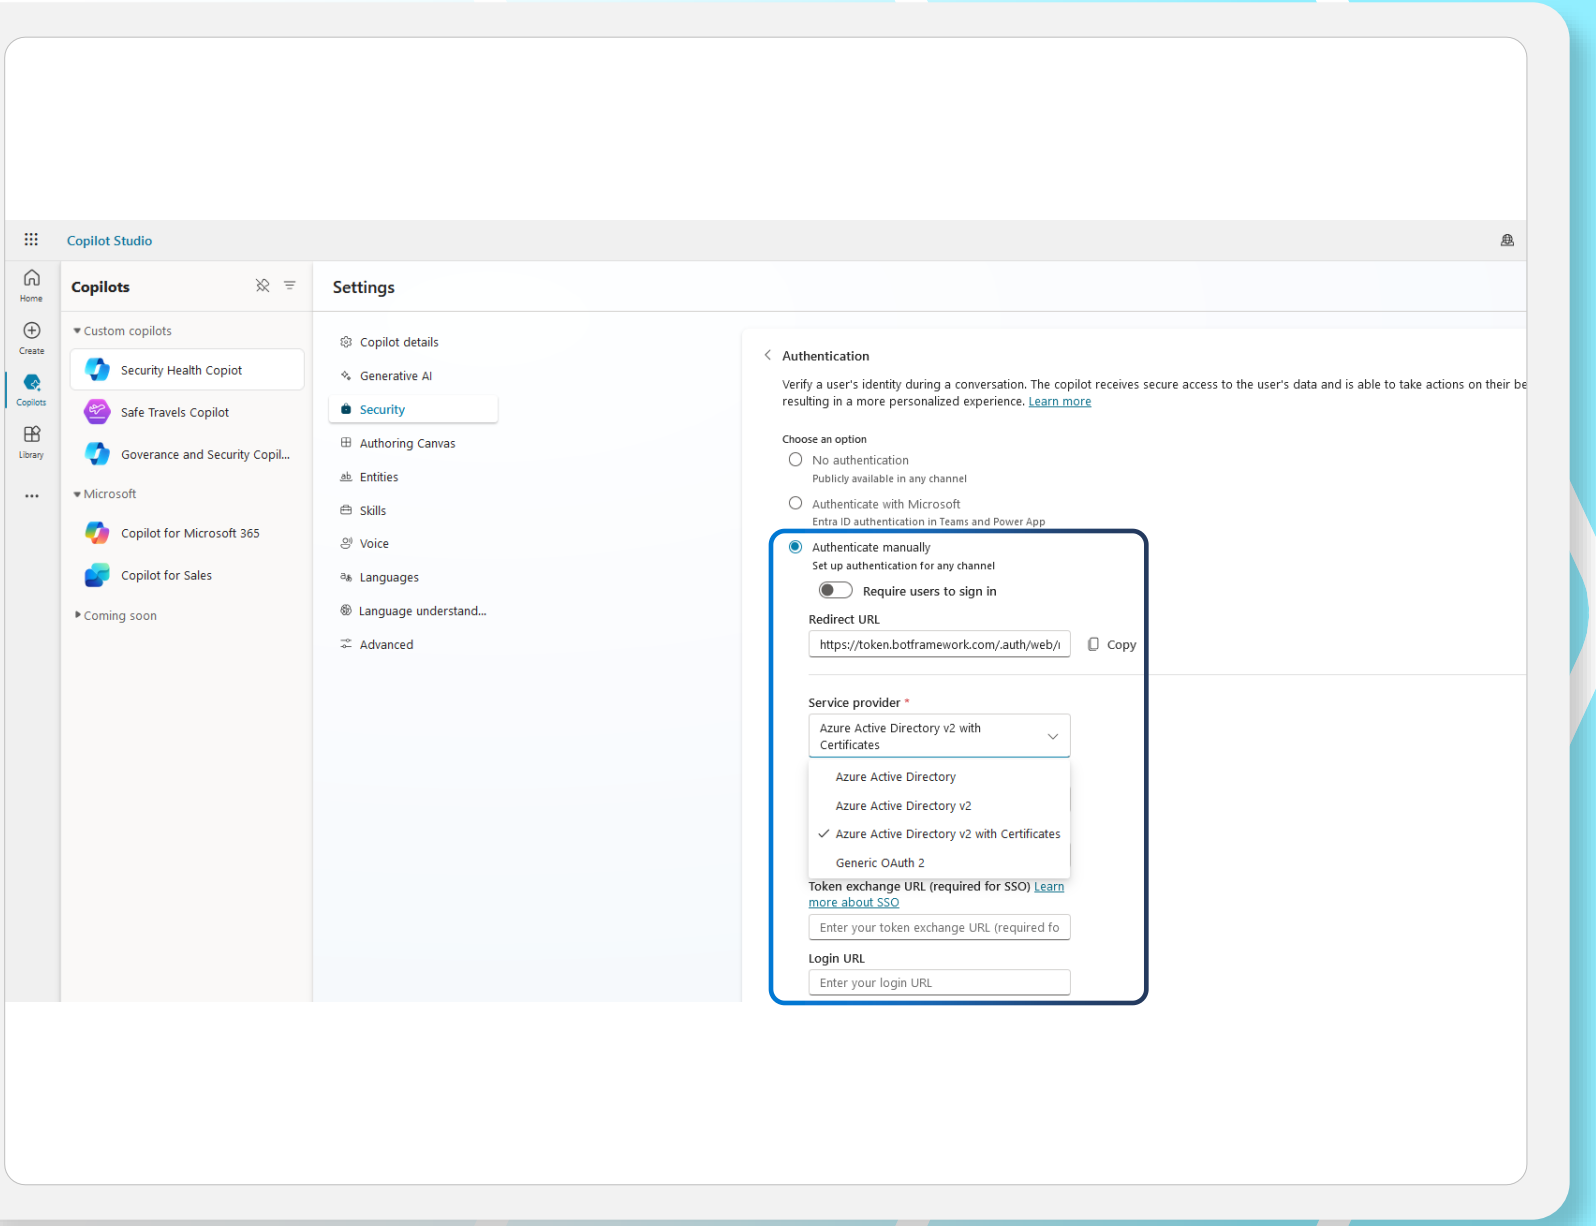

Authentications in copilot

Generally available

Copilot authentication is **secure** by default

Makers can select other **authentication options – Microsoft or Manual**

Admin can disable **no authentication** option for copilot

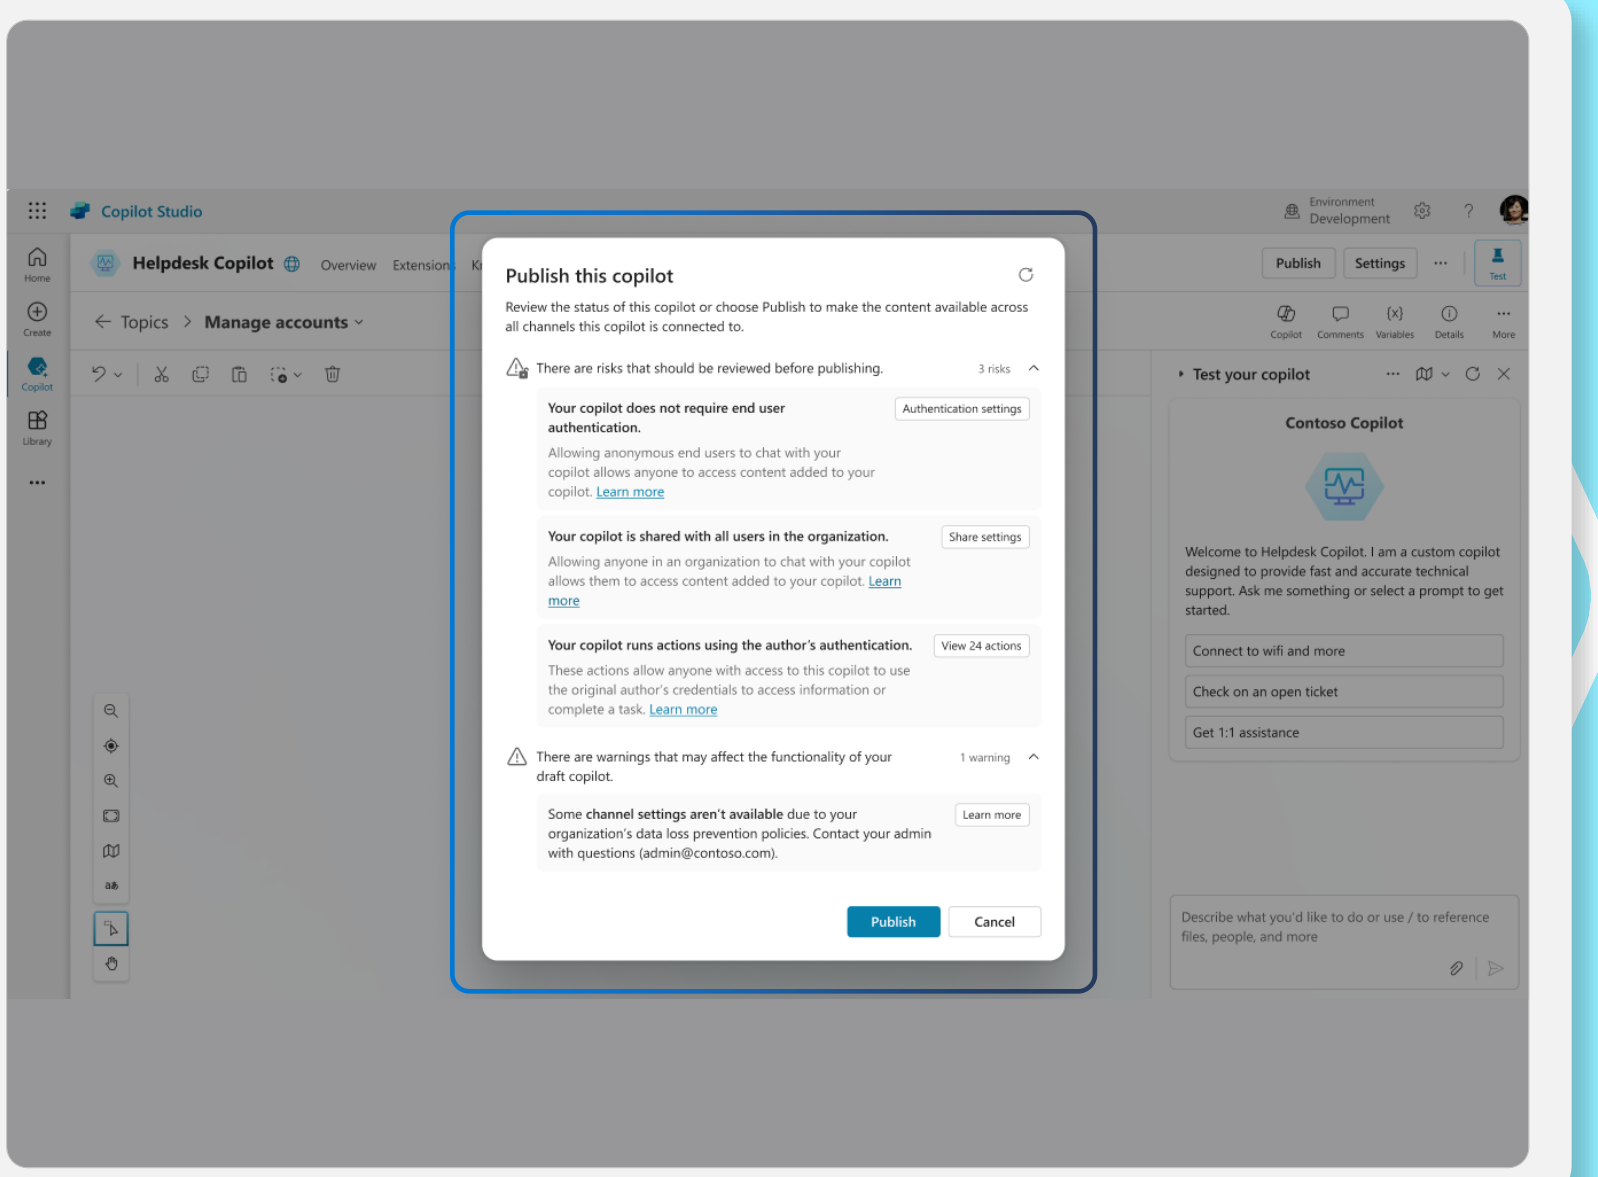

New

Warn makers to Secure copilots

Generally available

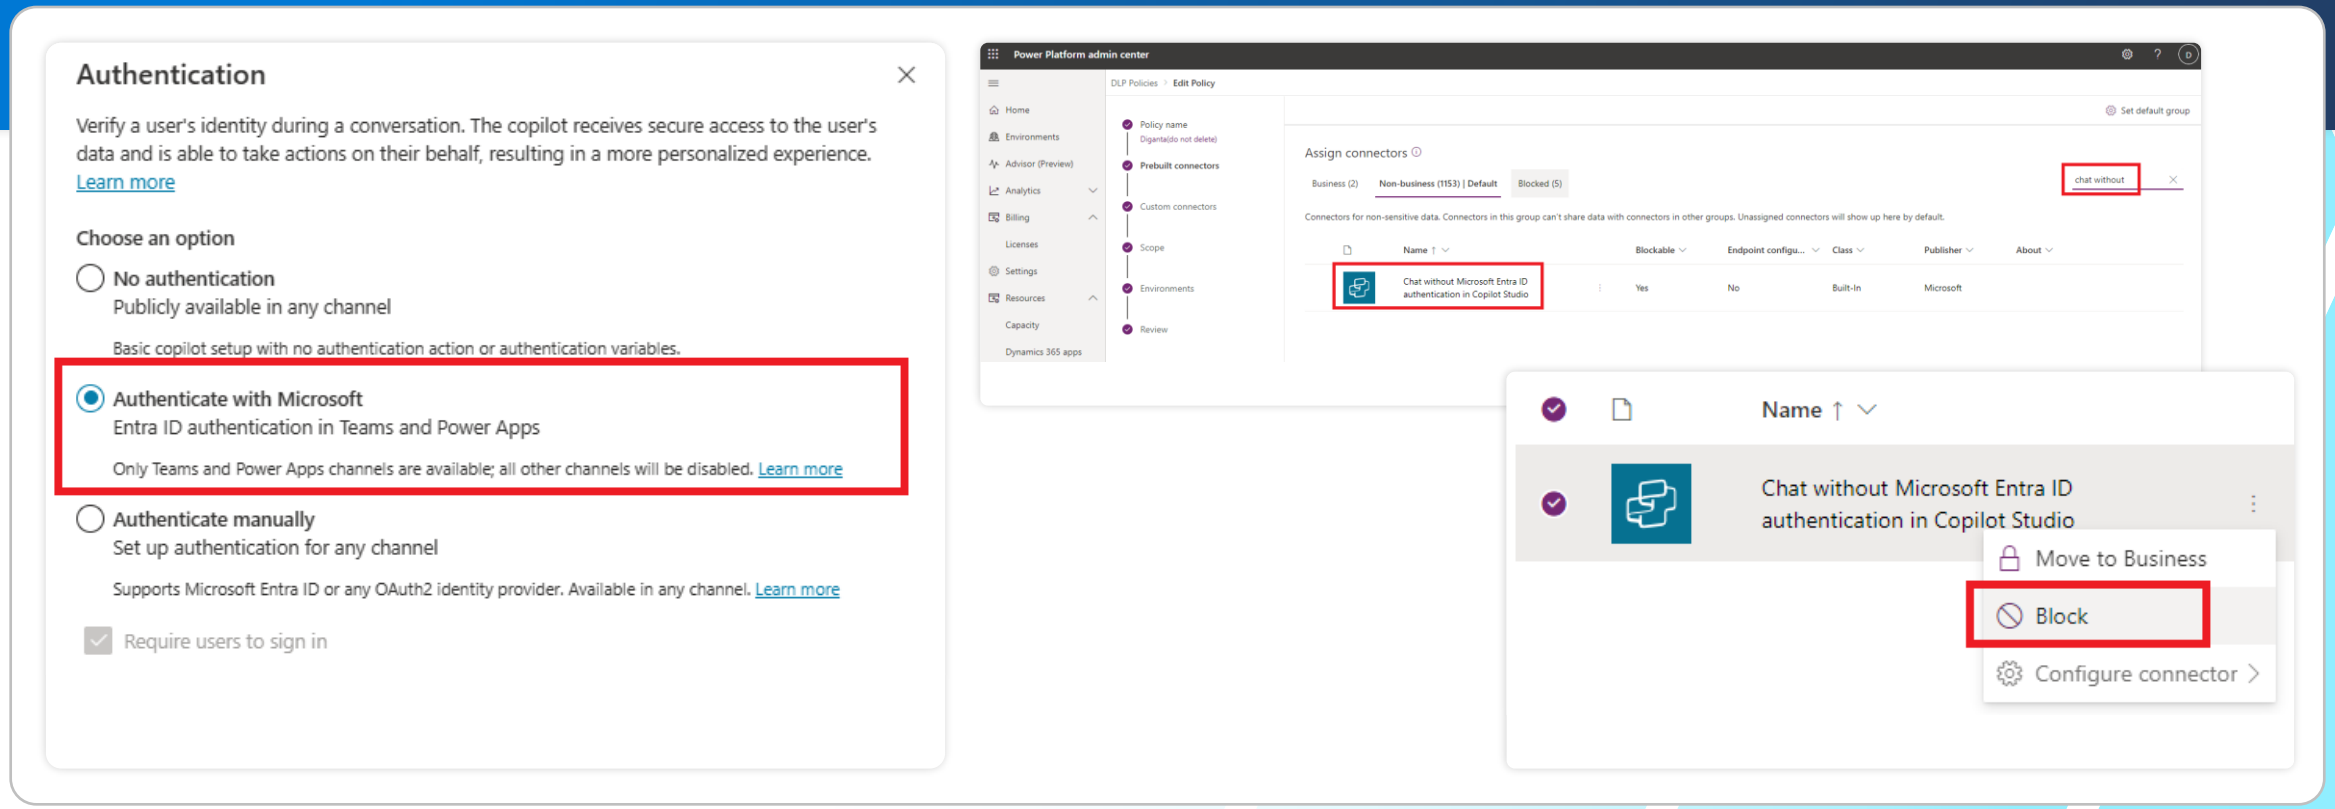

Maker can **monitor, protect, & manage** security of copilots

Copilot warn makers when secure by defaults settings are changed and suggest steps to enhance copilot security

Example: Require end-user authentication

When you create a new copilot, the **Authenticate with Microsoft** authentication option is turned on by default. The copilot automatically uses Microsoft Entra ID authentication for Authenticate with Microsoft without requiring any manual setup and only lets you chat with your copilot on Teams. However, copilot makers in your organization can select the **No authentication** option to allow anyone with the link to chat with your copilot.

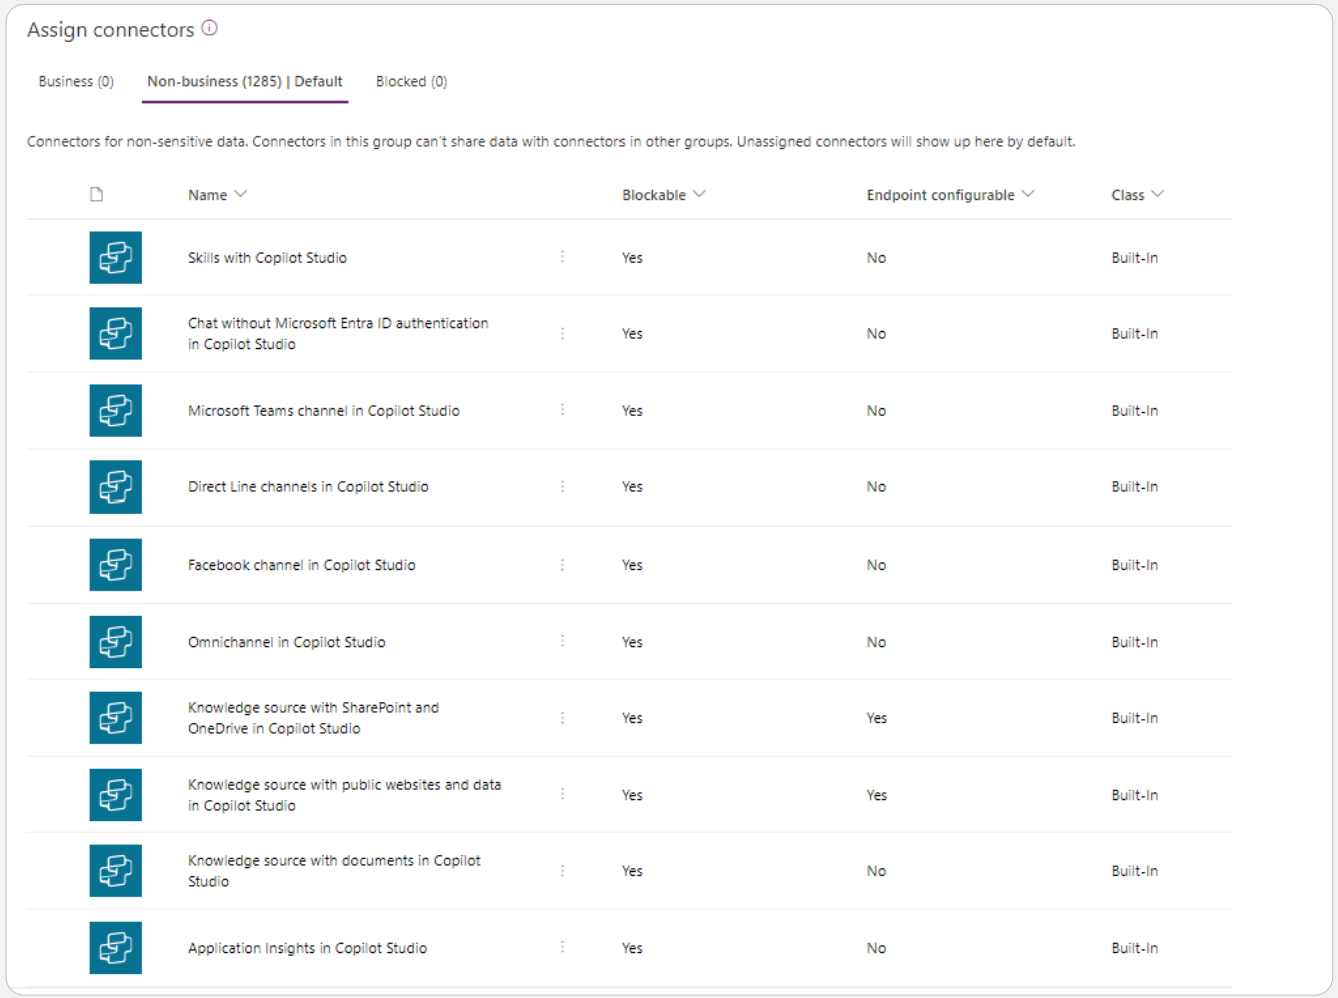

DLP Policies and Copilot Studio

The Power Platform Data Loss Prevention Policies also apply to Copilot Studio

The regular connectors in the connector library can still be assigned to business, non-business, or blocked

In addition, there are some Copilot Studio-specific connectors we can block (see image)

Security, copilot, & user management

Best practices to secure your Copilot Studio project

Assign licenses to users through Entra ID groups
Grant the 'Microsoft Copilot Studio User' license to users through a group instead of individual assignment.

Manage user access to environments through Entra ID groups
Only bot authors and a just-in-time admins should have access to your environments and data stores.

Manage security role assignment through Entra ID group teams
Within each Dataverse environment, leverage group teams to assign security roles to users.

Apply restrictive Data Loss Prevention policies to your environment
DLP policies can be applies to your environments to block all connectors that are not required by the project as well as any bot channel or setting that isn't useful for the project (e.g., unauthenticated use, use skills, etc.).

Review and only enable tenant, environment and copilot settings that are relevant
Tenant admins can disable publishing of GenAI-powered bots. Environment admins can disable GenAI features that require data movement outside of their region. Bot authors can require secured access for Direct Line. Internal chatbots can be limited for use by specific groups instead of being available to all.

Review and tighten security of all integrations
Connections should require strong authentication. Secrets should be stored in a secure location (e.g., Azure Key Vault). Leverage delegation, impersonation or filtering for data access in the context of an end-user.

Have a gated release process to production
Deploying changes from dev to test and to prod should require reviews and be part of a gated process.

Explore additional Power Platform, Dataverse and Entra ID security features
E.g., audit logs, customer-managed keys, customer lockbox, IP firewall, network isolation, multi-factor authentication, continuous access evaluation, etc.

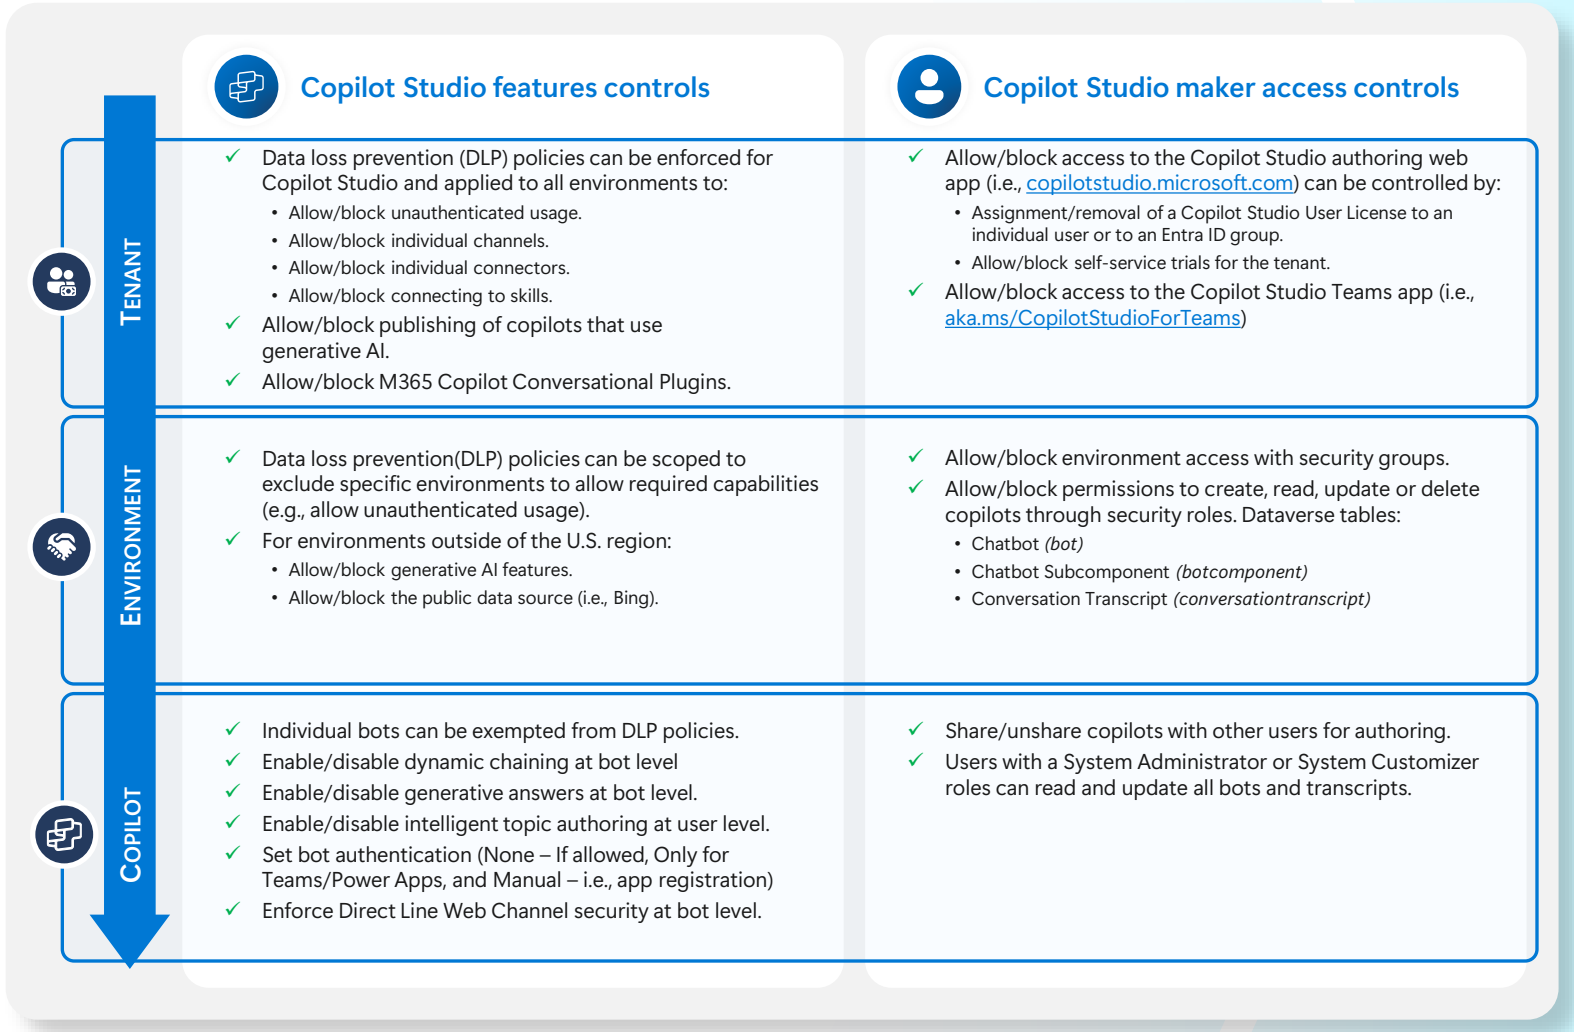

- Entra ID groups should be leveraged to fully drive user license assignment, environment access, and security roles assignment
- You should apply a most-restrictive approach by default and relax requirements on an exception basis

Useful resources

- Assign licenses to a group
- Control user access to environments
- Use group teams to assign security roles
- Manage data loss prevention policies
- Disable the ability to publish copilots with generative answers and actions
- Configure data movement across geographic locations for generative AI
- Configure web channel security
- Share and collaborate on chatbots
- Connecting and authenticating to sources
- Use environment variables for secrets
- Authentication variables
- Pipelines in Power Platform
- Activity logging
- Customer-managed encryption
- Customer lockbox
- IP firewall
- Virtual networks
- Microsoft Entra ID security best practices

Security and administration controls

Available security, governance and AI controls at the tenant, environment, or copilot level

- Data loss prevention (DLP) policies can be configured at tenant-level to apply either to all environments, only specific environments, or all environments except specific ones. DLP policies can enforce authentication, disable specific channels (e.g., Direct Line, Teams, Omnichannel, Facebook), block specific connectors, or block the use of skills. Individual copilots can be exempted from DLP policies
- The publishing of copilots using generative AI features such as generative answers can be completely blocked at the tenant level
- For environments outside of the U.S. region, generative AI features can be blocked at the environment-level. The public data source (Bing) can also be individually disabled

Useful resources

- Security and governance in Copilot Studio
- Enforce DLP policies for Copilot Studio
- Exempt a copilot from DLP policies
- Assign Copilot Studio user licenses
- Control user access to environments
- Manage app permissions in Microsoft Teams to block the Teams app
- Disable self-service trial sign-ups: Set AllowAdHocSubscriptions to $false
- Share a copilot for collaborative authoring
- Configure web channel security

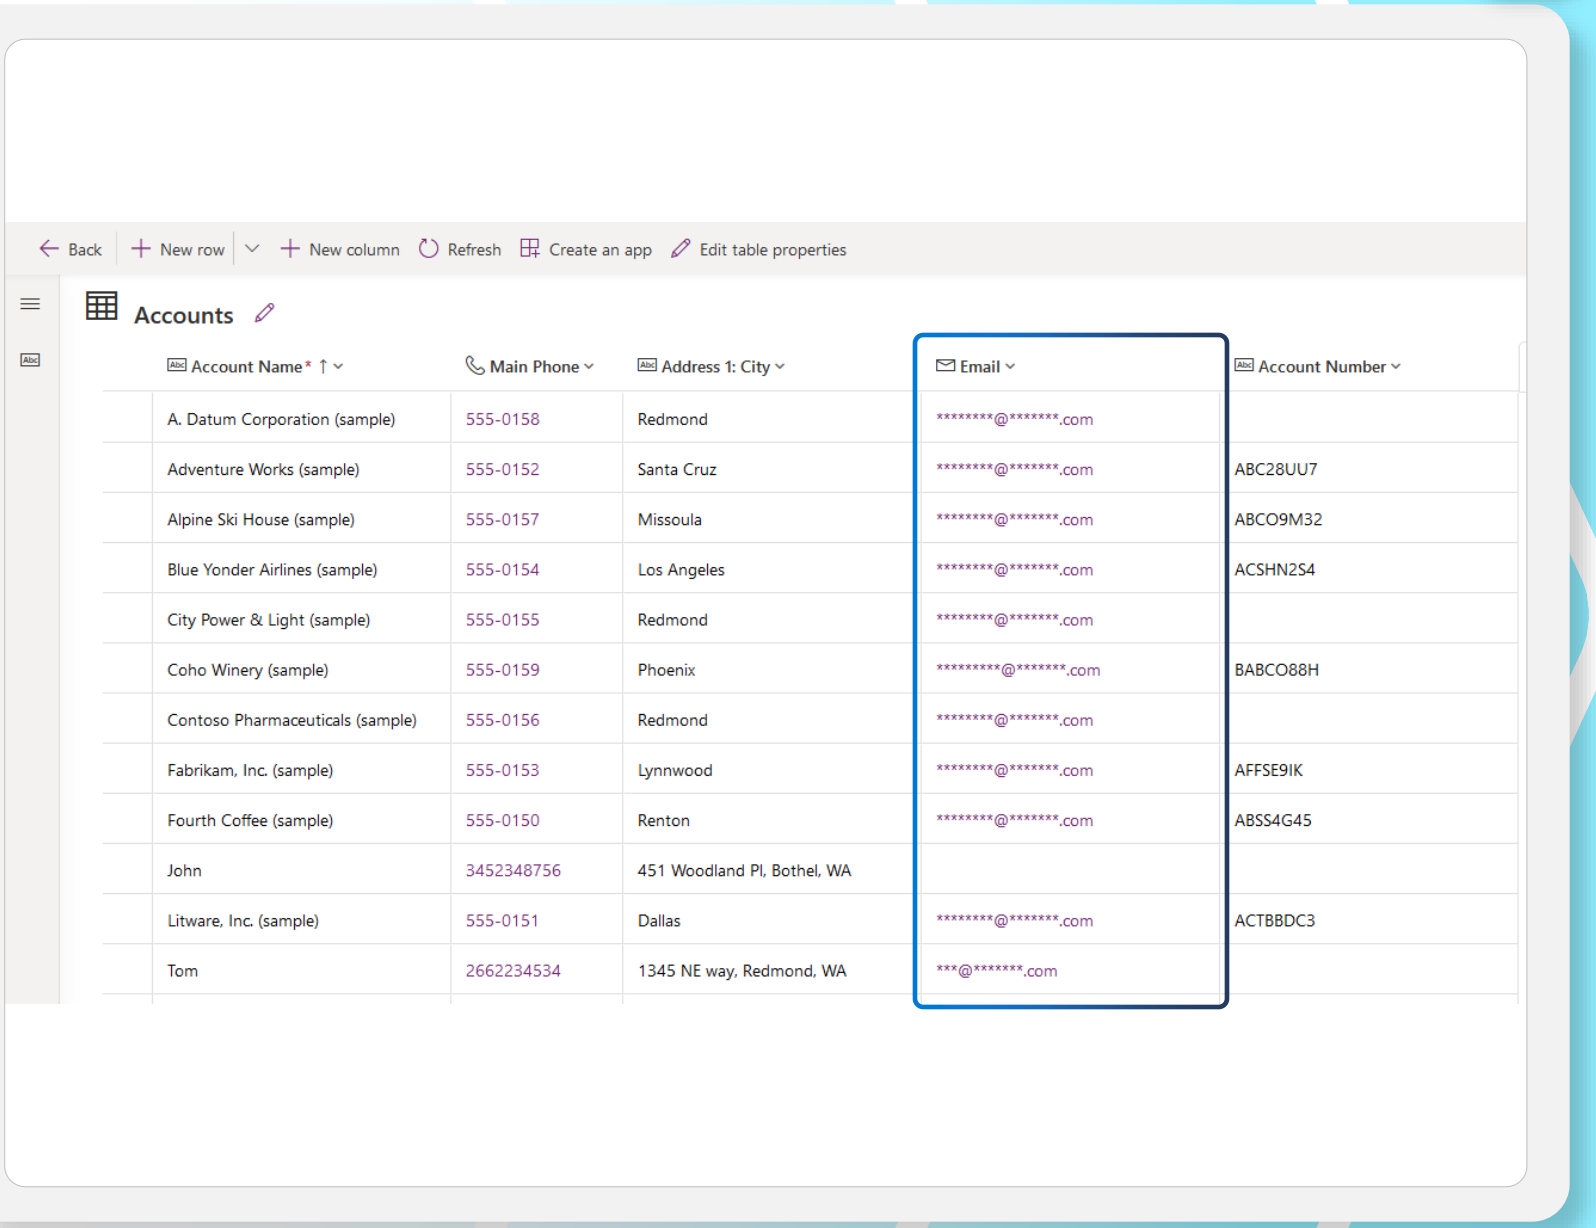

New
